

MAKE THE MOST OF NULTI-NEDIA

Are you wondering how to make the most of the multimedia resources available to you — scanned images (drawings or photos etc), video clips, music and sound samples, Replay movies, MPEG video clips or movies, teletext.....?

Computer Concepts offer a range of related products that can help you produce your own sound and video productions; all the hardware and software you need to input, manipulate and output stills, video and sound.

The ultimate multimedia expansion card — combining the functionality of a high quality (24bit) video digitiser with real time digital movie capture facilities, stereo sound sampling and playback, plus MIDI. All the software you will need to manipulate the captured data is included in the package — TakeTwo for

video manipulation, ScanLight for grabbing and manipulating still images, AudioWorks for manipulating audio samples and generating audio effects and !AudioCtrl provides mixing facilities. The card is also sold with real time video movie compression software from Eidos, which considerably speeds up and simplifies the process of movie generation. The video files you create ean be played back using Acorn Replay. Suitable for any Acorn RISC computer except 3000/4000 series, requires 2MBytes RAM and RISC OS 3.1 or later (4MBytes, an ARM3 and a high data rate IDE or SCSI hard drive for movie recording and sound output).

An optional extra is the latest release from Eidos — their Eidoscope video editing software, which can be used to edit movies

created on an Eagle card and includes many professional video editing tools.

Price: Eagle card with Eidos compression software: £329 + £6 p&p + VAT (£386.57 inc.) Eagle card with Eidoscope: £449 + £6 p&p + VAT (£534.62 inc.) Eidoscope for existing Eagle owners: £169 + VAT (£198.57 inc.)

A 16 bit audio sampling and play back expansion card. Features include stereo line-level input and output, MIDI connection and software support. A copy of AudioWorks is included to handle the capture, manipulation and playback of samples and a copy of !AudioCtrl which controls the Lark's sampling options (for example sampling to memory or disc, continuous of single shot sampling, background or foreground sampling and setting of sample rates and formats). Suitable for any Acorn RISC computer except 3000/4000 series, requires 2MByte and RISC OS 3.1 or later.

Price £199 + £6 p&p + VAT (£240.87 inc.)

MidiMax Card

An expansion card designed to provide a stand alone MIDI solution at an affordable price. A 16 byte memory buffer is included on the card for both transmit, and receive which means no data is lost even when the MIDI interface is transmitting at maximum rate. Standard MIDI In, Out and Thru connectors are provided, with the added benefit of a second Out connector to ease the interfacing of multiple devices. MidiMax is supplied with the same MIDI support software as the Eagle M2 and offers full compatibility with Acorn MIDI implementation. Suitable for any Acorn RISC computer except 3000/4000 series, requires 1MByte and RISC OS 3.1 or later.

Price: £69 + £6 p&p + VAT (£88.12 inc.)

ACORN WORLD

Combining the ScanLight 256 scanner (400 dpi, 256 grey levels) and GreyHawk digitiser. The digitiser offers real time greyscale video digitising from any video source. Includes the ultra-fast 'TakeOne' previewer, allowing live video in a window on the desktop — at quarter screen size this can update at 50 frames per second, far faster than any other digitiser. ScanLight software provides image enhancement of captured images, such as smoothing,

rotation, cropping, sharpening. Suitable for all models of Acorn RISC computer with 2MBytes.

Computer Concepts offer a range of other colour and greyscale scanners and digitisers — please ask for further details.

Price: £220 + VAT (£258.50 inc.)

The MPEG card allows full screen, full motion MPEG videos to be played back at better than VHS quality, with CD quality stereo sound tracks. MPEG videos can be played from hard disc or MPEG compatible CD ROM drives. Any Video CD format CDs are suitable (feature films, music videos etc) as are multimedia CDs that include MPEG clips. Any application that can display Replay movies can play MPEG movies. The software provides video type control over the movie eg fast forward, pause etc. Any frame can be

captured as a 24 bit full colour sprite. Requires a Risc PC with 4MBytes and a suitable RGB monitor or TV capable of 50Hz PAL modes.

Price: £249 + £6 p&p + VAT (£299.62 inc.)

TV tuner comes in two forms; a tuner only device which allows live TV to be displayed, either through connection to a video composite compatible monitor or in a window on the desktop in machines that have a digitiser installed. The user can scan the frequency range, set up frequency pre-sets and select channels. The second option with Teletext software can access and display all the pages available on Teletext, select Teletext or Fastext pages, decode foreign teletext and save pages out as either text or sprite files. Suitable for any Acorn RISC computer except 3000/4000 series, requires 2MBytes and RISC OS 3.1 or later.

Price: TV Tuner only £89 + £6 p&p + VAT (£111.62 inc.) TVTuner+Teletext software £159+£6 p&p + VAT (£193.87 inc.)

Pioneer 602X CD Rom drive

Many multimedia resources are supplied on CD, so Computer Concepts also include a CD ROM drive in their range. The Pioneer DRM-602X is a double speed (300 kilobytes per second transfer rate), 6 disc CD ROM drive. Multi session PhotoCD compatible. It can also be used for

standard audio compact discs. ArtWorks clip-art CD disc included. Suitable for any model of Acorn RISC computer, requires 2MBytes and a fully Acorn compatible SCSI card with CDFS 2.2.

RRP: £499.00 + £10 $p \phi p$ + VAT (£598.07 inc.)

Computer Concepts have other products in their range which can also be used in this field — for example a range of video genlocks, colour digitisers and flatbed scanners, the ColourCard graphics accelerator card and many more. Please ask for our Product Guide.

Editor's letter

I still remember the first time I played Elite. I was 14, it cost a fortune (for a BBC game), and it took me days to get into it. The fact that the centre section of my manual was missing didn't deter me from persevering, and I eventually became Elite on both the tape and disc versions. Next was the 6502 second processor version, and then, years later, the Archimedes version.

And that's the version on our cover disc. It's over 10 years since Elite first hit the world's computer screens, but Archimedes Elite is more than a 10-year-old game converted for RISC OS. It's the best version ever, and it's still the most addictive computer game I've ever played. Enjoy yourselves.

Next month in Acorn User

Reviews galore

We've had so much software and hardware arrive at the editorial office that there's almost no room to move. So next month we'll be bringing you pages and pages of the latest products, all put under the spotlight of Acorn User's reviews crew.

TAOS has been hailed as the future of operating systems for multi-processor machines, and with the forthcoming multi-ARM board for the Risc PC, the Acorn platform is shaping up to be an excellent development system for TAOS applications. Steve Turnbull unveils the future of programming.

Elite: the secrets

Following our fantastic cover disc this month, Clive Gringras co-author of the Archimedes version of Elite - describes what it was like to convert the greatest game of all time, and lets you into a few secrets about playing the game.

And, of course, there are all our regular features, education coverage and hands on section, plus the cover disc.

HOW TO ORDER

Carriage is free within mainland UK if you pay on ordering.

Cheques should be made payable to Ian Copestake Limited.

You may also pay by *credit card*, *debit card* or *Switch*. We normally make *no charge* for this, and take no payment until goods are despatched. We need your address as known to the card issuer.

If you leave an order on our answering machine please include your telephone number, your card number and its expiry date (and issue number if any), and your calculation of the total number and its expiry date. lation of the total payment due.

Official orders are welcome from UK educational and government institutions (invoices are due for payment within 14 days and are subject to carriage and late payment charges) charges).

VAT is not included. Zero-rated items are marked V0. UK customers please add 17½% to all other prices. EC customers outside the UK please do the same unless you are VAT-registered, in which case quote your international VAT number. Ours is GB 595 7258 84.

Overseas carriage: If you are paying by credit card we will add airmail and insurance at cost. Otherwise please add £6 (Europe) or at least £12 (elsewhere) for each software item and send a pounds sterling bank draft payable at a London clearing bank, or Eurocheques for not more than £100 each.

products, prices and cations are offered in good faith and are subject to change without notice. We process all orders immediately, but suppliers do sometimes keep us waiting. Goods are guaranteed but we do not supply them on approval. Returns and cancellations can only be accepted by prior agreement and there may be a charge to cover the costs involved.

Authorised Acorn Dealer and Developer

Please make cheques payable to lan Copestake Limited

What do these images have in common?

Not much, except that they were all captured in glorious 24 bit colour by the latest multimedia system - **24i16**. This combines an advanced video digitiser with a 16 bit sound sampler. As well as beautiful stills, **24i16** captures superb Replay movies and hi-fi audio. But don't just take our word for it..

"The image quality possible from 24i16 is the best obtainable...
...Replay quality is superior to anything else I have seen." Archimedes World

In fact **24i16** is a no-compromise design that surpasses all others in the Acorn World thanks to the following unique features:

- ♦ Compact Disc quality 16 bit stereo sampling at up to 48KHz
- ▶ Full frame still capture (resolution up to 768 x 576 with 1Mb option)
- Replay Movie capture of any size and rate limited only by machine and hard disc speed
- ▶ Capture rate up to 25 images per second and time lapse facilities
- Contrast, brightness and saturation control in real-time

For a limited time **24i16's** will be available for a special price together with **Empire** - Uniqueway's highly acclaimed Replay Movie editing package - so contact us now!!!

For the Complete Picture...

Irlam Instruments Ltd, Brunel Institute for Bioengineering, Brunel University, Uxbridge, Middlesex, UB8 3PH, Tel/Fax 01895 811401

Please note: **24i16** requires one expansion slot, RISC OS 3.1 or later, at least ARM 3, a hard disc and 2Mb RAM minimum. All hardware products come with full 1 years quarantee. E & OE.

News

Two-page Acorn update

INTERESTING things are happening at Vision Park in Cambridge. Over the past month a number of stories have emerged with important implications both for Acorn and for those who use its computers. Some of them have been wild speculation; others have been nearer the mark. Acorn User presents the definitive guide to what's happening at Acorn, Online Media and ARM Ltd.

Another Online Media deal

Online Media has returned to its roots with the announcement of its latest set-top box (STB) customer deal. STBs are more associated with leisure than education, but Online Media's latest customer, The Lightspan Partnership Inc wants to put Online Media STBs into US schools as well as homes. Could this hint at the ultimate destiny of Acorn Computer Group?

Lightspan is to trial the latest version of Online Media's STB, which uses the new highly integrated ARM7500 chip and an optional CD-ROM drive. Lightspan is already experienced in interactive educational applications in the US and hopes STBs will become a valuable tool in bridging the gap between the home and the classroom.

The idea is that schools install STBs in their classrooms and families install them in their homes too. This will not only give families access to leisure programming, but also identical curricular material to that being used at school.

No details are being revealed about the value of the Lightspan deal or implementation time scales, but nevertheless the deal represents another crucial trophy for Online Media in its programme to establish itself as a leading interactive multimedia player.

Not a profits warning

News of Online Media's latest deal with The Lightspan Partnership Inc. was balanced by a paragraph which was interpreted by the financial press as a profits warning. The statement read: 'In the UK, Acorn's personal computer business continues to experience difficult trading conditions which will again adversely affect results in the traditionally weaker first half of the year. This is despite a strong contribution from Acorn's flagship model, the Risc PC. Management action is being taken to address the situation.

'Progress at Acorn's associated company, Advanced RISC Machines Limited, continues to be in line with the Board's expectations.'

Acorn's corporate communications manager, Hilary Swift, explained that

Lightspan wants to use this box to link schools and family homes in America. Could this be the longawaited breakthrough for Acorn technology across the Atlantic?

while the press appeared to have treated the Lightspan Partnership news release as two separate stories, this had not been intended by Acorn.

The section about Acorn's personal computer business difficulties had simply been included to balance a single item of extremely good news with the core Acorn business and therefore not to misguidedly influence Acorn's share price, in line with stock exchange guidelines.

Indeed, at the time of the recent rights issue (see the April issue) Acorn User asked Acorn's managing director, Sam Wauchope what he expected of his company's prospects. There are no indications that the business plan he had then has been significantly changed. Acorn's share price dropped marginally by 2.5p to 90p.

New FileCore beta-test

Hard disc drive prices have fallen spectacularly in the last year. Three years ago, a 100Mb drive was a generous norm and 512Mb drive was an expensive luxury few could afford. Now a 1Gb drive can be obtained for less than £250.

Unfortunately, filing systems dating back from the 1980s (including earlier versions of PC DOS and RISC OS) have had built in limitations regarding the size of a hard disc they can address, usually set to an upper limit of 512Mb. This means having to format hard drives larger than 512Mb into two separate virtual drives or partitions, each no larger than 512Mb - a clumsy solution.

A revised RISC OS FileCore, the business end of the RISC OS filing system, has been developed to eliminate the 512Mb restriction by increasing the partition limit to 128Gb. Acorn Clan members will be given the privilege of beta-testing the new FileCore, which will probably happen around the time this issue of Acorn User is published.

The new FileCore is to be supplied as a software overlay on floppy disc. According to Acorn's Chris Cox, who oversees the Clan, the FileCore beta release is only intended for Risc PC machines.

He also confirmed that the new FileCore would only address hard drive size limitations and not other features like long file names. File names on RISC OS are limited to 10 characters, although the success of Jason Tribbeck's LongFiles utility, which extends this capability to 55 characters, shows that most RISC OS applications can cope easily with longer file names.

ARM710 and 700 updates

ARM 710 Risc PC processor upgrade modules will start shipping towards the end of July, according to Acorn. This is later than had been expected, but anyone waiting for an ARM700 upgrade, the version which can take a floating point accelerator chip, will have to wait much longer.

A problem running the ARM700 card with a PC co-processor is the reason. Meanwhile, the ARM710 - which is clocked at 40MHz compared to the standard ARM610's 30MHz - will be priced £100 as promised by Acorn last year. That price is in exchange for your old ARM610 card.

Silly season speculation

The summer months are traditionally a lean time for solid news, though this month's collection of stories does appear to contradict that trend. The Risc PC continues to do well, but being well past its first birthday, Acorn watchers are hungrily eyeing the horizon for new excitement from their favourite computer firm. Unfortunately, this often leads to some bizarre speculation.

That august organ of the Apple world Mac User, declared in its June 23 issue that Acorn was due to announce its participation in a Mac PowerPC clone manufacturing exercise. They even persuaded a senior Apple R&D vice president to agree that Acorn making clone Macs, among others, would make 'perfect sense.' Unfortunately it did not appear that Acorn had been consulted on the matter. Acorn User was met with a frustrated response from Acorn representatives who utterly denied the implication of its inclusion in the Mac User news story. Olivetti, Acorn's majority shareholder, apparently is seriously interested in Mac clones, while Acorn has indeed badged a PowerPC-based box in its new SchoolServer network offering. The best explanation is that someone put two and two together and got five.

Meanwhile, there has been some discussion on the Internet regarding

the suggestion that Acorn is working on a PowerPC version of RISC OS which would be licensed to any interested parties. Since IBM - with a marketing budget rather larger than Acorn's annual turnover - is struggling to establish its own OS/2 as a credible alternative to Microsoft Windows, even on the IBM PowerPC hardware platform, the idea of RISC OS for PowerPC doesn't look very sensible. And that's before you examine the technical considerations. Anyway, Acorn users need a better version of RISC OS before any messing about with non-ARM versions

Next on the speculators list is new machines. 'What new machines?' says Acorn. Nothing has been officially released to date on new machines. Naturally, if Acorn wasn't working on new machines we might as well all pack it in now; of course they are working on new machines and we will learn about them in due course. The ingredients and climate are all there: the old A3010/3020/4000 and A4 line are well past their sellby date, only the Risc PC is selling in decent quantities, Online Media has already applied the brilliant new ARM7500 composite computer on a chip and, last but not least, Acorn needs a real crowd-puller for the Acorn World show at the end of October.

FPA - lean and mean

In 1993 Acorn released the FPA10 floating point accelerator chip for the A5000. It was a 25MHz part and no good for the later 33MHz A5000 which was released prior to the Risc PC. Belatedly, Acorn has released the 33MHz FPA11 floating point accelerator for owners of the faster A5000.

Acorn's documentation indicates the FPA11 is 30 per cent faster than the FPA10 with typical 4MFLOPs performance peaking at over 6MFLOPs. The FPA11 will also be featured on Risc PC ARM700 cards once these are released onto the market later in the year. FPA11s are priced £99 + VAT and can be ordered from any Acorn dealer.

German market problems

Acorn is not abandoning the German market, but it has closed its Dusseldorf head office, with the loss of three jobs. Acorn has worked hard to establish a sales channel in Germany and this will be maintained from the UK by Acorn's International office, which is headed by Bob Coates. Sales in Germany are apparently not high enough to sustain a local office, but while considerable costs will be saved by the closure of the office in Dusseldorf, Acorn remains committed to nursing the fledgling German market.

PowerPC-based school server

Believe it or not, Acorn has launched its first RISC-based computer which is not based on in-house ARM hardware. A PowerPC processor lies at the heart of Acorn's new super network server for schools, called Acorn SchoolServer. The server hardware is made for Acorn by IBM and it runs a version of Microsoft Windows NT Server 3.5 tailored for school networks and Acorn clients in particular. In fact the system is based on Microsoft's own SchoolServer platform which was

launched at BETT in January and will enable a school to provide server support for Acorn, Apple and PC users on the same network.

An Acorn SchoolServer is a relatively powerful network server system for storing and retrieving files and software, sharing resources like network printers and CD-ROMs and for enabling multi-platform coexistence. For an Acorn client machine to connect with an Acorn SchoolServer, you need to install ANT Limited's OmniClient software, which is supplied as part of an server installation package.

For die-hard Acorn fans, the fact that Acorn has endorsed a flavour of Microsoft Windows and an alien RISC processor will be hard to swallow. However, the School-Server offering makes a great deal of sense. The days of Acorn-exclusive schools are numbered and there is a genuine demand for cross-platform compatibility at the network level. It also eases the adoption of Acorn client machines in schools which have not been able to consider buying Acorn computers before.

As commendable as it is, the Risc PC was never designed to be a powerful multiplatform server machine. It could have been worse, the server Acorn might have chosen could have been Intel-based, but at least Acorn's belief that RISC is best is still enshrined in the IBM hardware chosen.

Acorn, on the other hand, will reassure its established education customers that their investment in other Acorn networking solutions - like Access and Level 4 Fileserver release 3 – is safe, as these remain core Acorn products.

Acorn SchoolServer is regarded as a high-end solution for large schools with an extensive network which probably has to serve more than just Acorn client machines. Ironically, Acorn - which A PowerMac, badged by Acorn and running RISC OS very vocal critics, is now endowed with Acorn's future plans.

a Microsoft label considered prestigious in the PC industry - that of being a Microsoft Solution Provider. Even more ironic is that a collaboration like this points to a more prosperous and stable future for Acorn.

Pocket Book price cuts

Acorn's successful custom version of the Psion Series 3a pocket computer, the Acorn Pocket Book II, has been made even more attractive with some useful reductions in price.

The Pocket Book II with 256K RAM has been reduced from £229.74 + VAT to £205 +VAT. The 512K RAM model drops from £280.81 + VAT to £255 + VAT and the Pocket Book II Class Pack, consisting of ten Pocket Book 256 IIs, a desktop data link, parallel printer link and a mains power supply, has dropped by almost £250 to £2050 + VAT.

Acorn reveals that over 15,000 Acorn Pocket Books have been sold so far, with Class Pack sales doing especially well.

has indirectly been one of Microsoft's on its PowerPC processor, is apparently not part of

Still the leading subscription-only magazine users of Acorn RISC computers

worth of invaluable nformation for half the price piece of budget software!

Our readers range from those who want to understand the technicalities of their computer, through programmers, educationalists, business and professional users, to the less experienced

users who need simple, down-to-earth advice without jargon. Each issue of RISC User has plenty for everyone.

We give you up-to-the-minute news on all that's going on in the Acorn world.

We go behind the doors of the major developers and tell you what they're really thinking and planning.

We give you detailed practical advice on how to get the best out of your software and hardware.

We review all the important software and hardware releases, and also publish group surveys covering all the major products in a particular field.

Our reviews and practical articles are written by authors with years of expertise in the field, not by busy journalists.

New low-cost SyQuest drive

The new removable hard drive from SvOuest

SYQUEST, a long time innovator on the removable disc drive scene, has introduced a new low-cost removable disc drive aimed squarely at the consumer or SOHO (small office home office) market. The new 135Mb EZ135 drive is expected to sell for around £149 + VAT and spare cartridges will cost around £12.50 + VAT. SyQuest drives are popular in the publishing industry, in which Acorn has a presence.

However, EZ135 cartridges are not compatible with SyQuest's existing professional range of removable drives. 135Mb sounds modest in a time when 500Mb static drives are rapidly approaching the £100 mark, but SyQuest believes the convenience of a removable drive like the EZ135 will make it a winner. Higher capacity EZ drives are expected to follow.

> Herald Communications Tel: 0171-222 8515

iSV latest

FONT specialist iSV Products has announced its latest font pack, a Hebrew word processor and a new catalogue. The new word processor, called AlephWriter, is currently being beta-tested and allows Hebrew text to be entered from right to left. Text can be exported in both Draw and Impression formats and a variety of Hebrew fonts will be supplied with it when it ships later this year.

Talking of fonts, 298 RISC OS 3 fonts are contained in the latest iSV font pack. This includes fully scaffolded Latin 1 character sets, Welsh characters and kerning pairs. There is also a new font installer which is designed to work both with Fabis Computing's EasyFont package and Look Systems' FontDir. A special offer is currently being run whereby customers can buy both the new Font Pack 298 plus the earlier Font Pack 277 for £46.50 inc carriage. On its own, Font Pack 298 is priced

For more iSV information, including Issue 3 of the iSV product guide or a £2 demo disc, contact iSV.

> iSV Products Tel: (01344) 55769

Faster, cheaper 486s

Aleph One has introduced a better value, faster version of its unique higher performance Risc PC 486 card. The new model uses an 80MHz 486 processor instead of the earlier 66MHz part but the price is unchanged at £399 + VAT. Software support has now been extended to include 1280x1024 screen resolutions plus 24-bit colour if 2Mb VRAM is fitted. At the same time, Aleph One has reduced the prices of its old-style 486 PC podules; the 25MHz version is now £299 + VAT without RAM and the 50MHz version is £349 +

> Aleph One, Tel: (01223) 811679 Fax: (01223) 812713

Multimedia success

Four of the triumphant schools in this year's NEMA (National Educational Multimedia Awards) event, used Acorn computers to create their winning entries.

Acorn-using NEMA winners were Hempsill Hall Primary School in Nottingham, Stephenson Way Primary School in Co. Durham, Handcross Park School in West Sussex and Northgate Primary School in Bishop's Stortford.

Prizes will be officially awarded by computer games star Dominik Diamond at the NEMA awards ceremony which will be opened by Eric Forth, Minister of State for Education, at the Birmingham Repertory Theatre on July 26.

The Senlac craft

Brighton-based Acorn dealer Senlac Computing generated some welcome publicity for itself and for Acorn in the local press, always welcome at a time when Acorn is frequently overlooked.

The report concerned Senlac's recent and unusual accreditation as an official member of the Guild of Master Craftsmen. Senlac Computing joined the Guild because there was no equivalent body dedicated to the computer busi-

Senlac's managing director, Peter Sykes, said he hoped that by being a member of the Guild he would be able to help assure potential customers that they would be dealing with a solid and reliable company.

Eesox CD-ROMs

CD-ROM specialist Eesox has reduced the prices of its Gold range of CD-ROM drives, improved the specifications of its Silver range and introduced a new Platinum drive, plus a new parallel port drive. All drives now get a £30 voucher towards CD-ROM mastering orders placed with Eesox.

The new Silver range specifications improve reading speeds from 2x to 2.4x and this is combined with a faster seek time to give an average of 60 per cent improvement. Silver range drives start at £149, Gold range drives are reduced in price to £249 for the 4.4x speed (660K/sec) tray-loading model and from £299 to £279 for the 4x caddy-loading model. The new £419 caddy-loading Platinum drive, sourced from Plextor, is the fastest yet, with a 6x speed (900K/sec) mechanism. All prices exclude VAT.

For Acorn machines with the second generation chip-set featuring a bi-directional parallel port, Eesox has introduced a budget £199 inc VAT parallel port 2x speed drive. Network CD-ROM towers, holding between two and six drives apiece are now available, starting at £479.

Eesox Tel: (01223) 264242 Fax: (01954) 789078

Spring Show a success for the public

THE 1995 Acorn User Spring Show was a success for the visitors and exhibitors alike, said Geoff Potter, managing director of organisers Safesell Exhibitions. This year's event was only two days long compared with previous three day events, so overall attendance was down - with a marked reduction in the number of teachers visiting the event this year.

However, many exhibitors found that the calibre of visitors attending the show was very high. Computer Concepts, who had half-price software offers, sold out of several product lines before the first day was out. There were similar stories from Cumana and Uniqueway, while Castle Technology reportedly said that it was their most successful show yet.

'We only had one complaint,' said Potter. 'An exhibitor criticised us for not having the event more often and not far enough north!'

Whether the show was successful enough to survive for another year remains to be seen.

Innovation from Longman

month Longman Logotron has announced a pair of innovative teaching aids for the classroom - Junior Insight, a science data logging application for key stage 2 and 3 pupils, and LRTV (Look and Read Special TV) which supports the BBC Schools TV programme of the same name.

Junior Insight is a cut-down version of the original Longman Logotron Insight package designed to help teachers design data handling projects which can capture the minds of their pupils. In this junior version of the program, the menu and control panels have been simplified for use with younger pupils. Data can be captured from continuous sensors like thermometers, light sensors, etc., plus switch sensors like light gates and pressure pads. Sampling rates can be altered and data can be shown in table or graphic form.

Niall McAtasney, systems manager for Superchoice, the Active IT course providers, commented: 'The simplified menu and control panel of Junior Insight opens up all kinds of learning opportunities for younger pupils in the classroom. By relating IT to the real world with fun activities. limited only by the teachers' imagination, data handling requirements of the national curriculum can be achieved in an enjoyable and memorable way.'

Junior Insight is compatible with popular sensory interface kits like Unilab, Sense and control, LogIT, SenseIT, Philip Harris hardware and the new LIVE box - a new low-cost system designed specifically with the national curriculum in

LRTV was developed in conjunction with BBC Educational Publishing as part of its Look and Read series. LRTV activities are set set in a breakfast TV studio. One of the interactive scenarios is a news desk in which pupils need to check story spelling and punctuation after mischievous computer viruses have played 'full stop football' with the news. Key Stage 2 English topics, includwriting, punctuation, spelling and grammar are covered by LRTV. Ten interactive activities are included on floppy disc, along with story boards, illustrations and pupil activity sheets. Other Look and Read series include Earth-Skyhunter, Geordie warp, Racer and Through the Dragon's Eye.

Junior Insight is priced £44 + VAT for a single user or £143 + VAT including a LIVE box. LRTV is priced £25.50 + VAT.

Longman Logotron has also announced a CD-ROM version of PicturePoint, a new data handling package for young children. With the aid of colourful pictures and talking graphs, PicturePoint aims to introduce the disciplines of data collection and data analysis to Key Stage 1 pupils. The PicturePoint CD is priced £29 + VAT and a site licence is costs £90 + VAT.

> Longman Logotron Tel: (01223) 425558

No illusions

After three and a half years and 20 issues, Illusions disc magazine is no more. Illusions has ceased to be due to lack of funds. Illusions blames its predicament on an unsuccessful partnership with the games software house, Games-Ware. In its time, Illusions could rightly claim to be the most popular Acorn format magazine on disc, absorbing rivals State of the Arc plus Virtuality along the way.

More SoundLab enhancements

SoundLab, the sound processing utility supplied with Oak Recorder sound samplers from Solent Computer Products, has undergone further enhancements as suggested by existing users, according to the company.

Additions include a reverse option which can be applied to all or part of a sample, plus effects like echo, fade and filter. Samples can also be cut to the clipboard and merged with others. The software is also easier to use for smaller children and there are two new BASIC utilities demonstrating the use of sound module SWIs. Software upgrades are available for £5 + VAT.

> Solent Computer Products Ltd, Tel: (01954) 789701 Fax: (01954) 782186

Handy audio applications

A family of three CD-ROM utilities for users playing audio CDs has been produced by Jonathan Hunt. AudioCD is a CD playback utility which also displays the title of the track being played, AudioFS is a RISC OS filer front-end for audio CD tracks and KeyCD is a multitasking CD player control utility. All three utilities cost just £5 from Jonathan at 21 Green Street, Milton, Northampton, NN7 3AT.

Risc PC dino-help

Acorn has provided The UK Dinosaur Society with a pair of Risc PCs fitted with 486 cards as part of a sponsorship deal. The society, which promotes scientifically accurate books on dinosaurs, says that in return, books will feature the Acorn logo. For more information on the Dinosaur Society UK, phone (01227) 700116.

Northwest SEMERC in Oldham has produced a major catalogue of software and hardware products for schools and special needs establishments. The full colour 40 page catalogue includes details of 300 software packages for Acorn, PC and Apple Mac users, plus hardware products like CD-ROM drives and overlay keyboards. The SEMERC catalogue is available on request from SEMERC, tel: 0161-627 4469, fax: 0161-627 2381.

New range

THE EIGHTH edition of Cumana's CD-ROM/Multimedia and Networking Portfolio has been released, reflecting Cumana's increasing activities as both a publisher and a manufacturer able to provide support for individual products as well as site-wide networks. New products range from educational titles, the new CD-ROM/re-writable optical drive and the SJ Research Nexus ATM networking solution plus Nucleus file server.

> Cumana Tel: (01483) 503121 Fax: (01483) 451371

The Pineapple Software Virus Protection Scheme available against computer viruses. !Killer together with VProtect will detect and remove all of the currently known 71 families of virus (over 100 viruses in total). Because new viruses are being discovered all the time our virus protection scheme will provide you with 3-4 updates of the software each year. We can also offer immediate advice by 'phone. !Killer can scan any filing system or device including floppies, harddiscs, networks, even

CDRoms. All types of compressed file can also be scanned. All infected files are fully restored without having to reload from master discs or backups.

Don't wait until you discover you have a virus! Use the software that Acorn themselves use to check for

viruses.

A years subscription costs just £28.20 inc vat

Low cost school and county licences available

Acorn Computers

We are fully authorised Acorn dealers and we can supply all Acorn computers and upgrades at very competitive prices, usually by return of post. All Acorn computers are supplied with

free membership of the Virus Protection Scheme and a special offe

on our Studio24 painting package of just £94.00 inc vat.

Please see our other advert for details of computer prices.

We can also provide professional advice and assistance to help you choose

A4 Colour Scanners

New from Pineapple the superb IX-4015 A4 flatbed Canor colour scanner. Supplied with Imagemaster and Twain software this scanner makes the perfect companion for our Studio24 re-touching software. With a basic resolution of 400 x 800 dpi this scanner is unbeatable value.

IX4015 with Imagemaster & Twain £675.00 As above + Studio24 SCSI interface + cable 'phone

Epson Colour Scanners

Also supplied with ImageMaster and Twain software these models can work on either SCSI systems or via the Parallel Port. Basic resolution of GT8500 is 400dpi and the GT9000 is 600dpi

GT-8500

17.5% vat. Carriage FREE to mainland U.K. Phone for quote outside U.K. Official orders, cheques and all major credit cards accepted. Money back guarantee on all products.

For demonstrations of most of our advertised products why not come and visit us in our new offices (easy parking) where you can see most of the Acorn range of computers and other hardware in action.

Graphics

No other alternative

ALTERNATIVE Publishing first released *ImageFS* well over a year ago with the intention of making bitmap file importation easier than swimming with armbands. The program certainly lived up to expectations with all the ingredients of a *cordon bleu* file filter; fast in operation, quick to load, seamless in action, but not all that expensive.

There's always room for improvement though (those immortal words of my old chemistry teacher finally finding a use), and Alternative Publishing has most definitely not been resting on its laurels regarding *ImageFS*. The program now handles everything under the sun, including Sun 1/8 bpp uncompressed files (to name but one of the common rarities of image file floating around out

there in cyberspace or the infobahn, or whatever it's called – call me confused but I really feel there should be a filter for this crazy jargon business (oo)

The program, which stands at version 1.61 at the time of writing, is an alpha test version of the forthcoming *ImageFS*² which should be with us shortly. Despite being at such an early stage of development, its improvements already work competently. Some of these include very powerful and well-designed interface features when saving, importing and previewing files. When saving, Alt-drag elegantly opens a window, in a very Mac-esque manner, providing simple conversion to all sorts of file formats including PCX, BMP, Clear, PBMPlus, Targa, AmigaIFF and many others. Of course, the industry standard

Seamless importing and easy file conversion when saving with ImageFS²

GIF and TIFF formats are also offered and all these converters work for importing as well. Still unfinished is *TinyView*, a 200x200 or 400x400 pixel preview facility which works by Ctrldouble-clicking on any supported bitmap file – including sprites of every variety – opening an attractively designed window with the sprite inside. If you like what you see, you can drag the image directly into a bitmap editor or DTP program.

This program is a definite must for those dealing with lots of wacky bitmap formats, and I wouldn't be surprised if something similar for vector or DTP files was also to find its way to our desktops.

Alternative Publishing Tel: 0141-248 2322

Compo out now

A beautifully boxed and manualled *Composition* package found its way onto my desk recently. It must be said that Clares has done it again with its packaging which really has become the leading edge in the Acorn platform.

After weeks of use, I have not been able to find any bugs in the final pre-release, so one can be fairly certain that only freak mishaps will interfere with the full release. Composition is an extremely fast, fully-layered image workbench but as it is unchanged features-wise from the last pre-release, it lacks something in ease-of-use.

Compo is an object-based image manipulation package, not a bitmap editor with layering, so all functions should be mouse operated and previewed on the fly, just like packages of similar nature on the Mac and PC. This is not yet the case for Compo. I know Clares is determined to drive the development of this package which has a fast and powerful foundation. The future bodes well for this package, and so looks brighter for the Acorn graphics user.

Clares Tel: (01606) 48511

Top tip

A small tip for those using Impression for DTP with the intention of getting the document imageset for professional printing: when loading ArtWorks or Draw files into a frame, make sure the original file is of a reasonable size. Dropping in an image or clipped chunk of image which is very small and then having to enlarge it by over 500 per cent in Impression will possibly give positional problems on some printers and imagesetters, so simply enlarge small images before importing them.

Contacting me

You can contact the Graphics page by writing to me, Jack Kreindler, at Acorn User, IDG Media, Media House, Adlington Park, Macclesfield SK10 4NP, or by e-mail to: jack@acornusr.demon.co.uk.

Pic of the month

BENJAMIN Shimmin of Bolton is this month's winner, coming out on top of a number of excellent entries which will be carried over into future Pic of the Month competitions. Benjamin – who is 12-years old – produced this, and two other images also inspired by food, using *ArtWorks*. They were sent as sprite files, however, so the full resolution could unfortunately not be printed. Despite this, the image still shows very good draughtsmanship and colour sense.

Another well-deserved £20 leaves our hands and makes its way, this time, to Bolton. Next time it could be your neck of the woods, but please remember to send in your sprites, JPEGs, Draw files, ArtWorks files, Composition files, whatever you fancy, with a little explanation and your name and address on the disc. JPEGs are best for huge sprites and the original vector files for vector work.

Termite Internet

Have you surfed the Internet yet?

Termite Internet provides access to all the major facilities of the Internet with the minimum of fuss, and absolutely no cryptic commands. Instead, a descriptive control panel is utilised to make your entry to the Internet as painless as possible. Clicking on the icons opens icon-based interfaces, from a live clock face to show the time, to extensive WWW browsing facilities.

The World Wide Web, a relatively new feature on the Internet, allows you to jump to any site on the Internet and view interactive text and graphics. Most of the world's major companies provide WWW sites so that you can see details of their products and services, but the majority of pages are general information made available because of their authors' interests or hobbies. There is information on virtually every topic imaginable on the WWW, a selection of which is shown opposite.

The Internet is a global network of hundreds of smaller networks. Hence, no organisation owns it as a whole. Most of the component networks are run by corporations, governments, and academic institutions, but some (known as *Internet providers*) allow single users to connect to the Internet using a computer, modem, and suitable software.

Although you can view information from anywhere in the world, all you have to pay is the phone call to your Internet provider (which is usually a local call). Even your mail which could travel hundreds of miles doesn't cost you more than the call cost for the time it takes your message to go from you to your provider — just a matter of seconds!

For more information on Termite, Termite Internet, modems and how you could be connected to the Internet — send SAE suitable for a disc to our address below.

£79.95

Plus £3 p&p. Upgrade from Termite (non-Internet) £30. Credit cards accepted.

Comms

Paws for thought on the Web

THIS month I was going to shout the news from the rooftops that Acorn Computers' own World Wide Web service was up and running, but at the time of writing, it is not. This is a pity, because the demonstration at the Acorn User show featured a really excellent home page designed by Acorn's new WebMaster, Paul Lebeau, which I'd like to show you. Maybe next month?

So instead, here are some pictures of cats - Atomwide cats to be precise. These splendid creatures are featured on a sub page of the Ant Ltd World Wide Web server in the Atomwide Ltd section. If you have ever visited the Orpington, Kent headquarters of Atomwide Ltd for Acorn repairs or state-of-the-art upgrades and accessories, you will know that while you are being served, you are just as likely to end up nursing a cat as a computer.

The Ant Ltd World Wide Web server software responsible for this page is expected to

WebCats waiting for the next page?

become part of the forthcoming Ant Internet Suite. It was my experiment with FreeNet and ArcWeb (see below) that fetched this page, and it's interesting to note that any Internet client software written to work with FreeNet will be entirely compatible with the Ant Internet suite, so your favourite FreeNet Internet Relay Chat software will work with either package. I

understand that *Termite Internet* from DoggySoft unfortunately does not have this compatibility, but no doubt modules for such functions will become available from their support BBS Furzefield HQ.

Competition can only enhance the quality of products available in this burgeoning market. Will we be able to afford the phone bills though?

Devon Trinity

Trinity BBS in Exeter, Devon, is one of the few in Southwest England with an Acorn area. It's a PC system run by John Burden, the area's FidoNet Co-ordinator. The BBS forms part of the echomail 'backbone' message distribution system, also giving users access to Internet e-mail and newsgroups. Co-sysops Alex Howarth and Neil Bullock have the job of expanding and developing the Acorn section and welcome new callers and comments. Trinity BBS has two V.32bis lines and a third for speeds up to V.34.

Trinity BBS Modem to: (01392) 410210/412370 V.32bis or (01392) 495899 V.34

NewsFlash!

A new Shareware BBS software package for Acorn machines is in development by Chris Davis called NewsFlash. Although it is still in a very early version, Newsflash can be downloaded from Arcade BBS. It is worth looking at just to see the supplied example BBS called OuijaBoard, which has some very clever 3D-look ANSI menus. Watch out for further developments.

The Archinet

Another system dedicated to Acorn's range of computers has opened, this time located in Ashford, Kent, Ben Brown's The Archinet BBS, also runs ArmBBS on a Risc PC with a USR V.34 Sportster modem. Ben's system has over 117Mb of files to download and carries all the 'backboned' Acorn-interest Fidonet echoes. Archinet is online from 9pm to 7am seven days a week. The BBS is a full Fidonet node at 2:440/610.0, and ArmBBS is shortly to become fully FidoNet compliant.

The Archinet (01233) 635436

Contacting me

You can contact the Comms page by writing to David Dade, Acorn User, IDG Media, Media House, Adlington Park, Macclesfield SK10 4NP, or by e-mail to: DaviD@arcade.demon.co.uk, or mail #2 on Arcade BBS 0181-654 2212.

Making the connection with FreeNet

I SURPRISED myself this evening by actually getting *FreeNet*, the freeware TCP/IP stack modules for Acorn 32-bit computers produced and ported by Tom Hughes, to work with Stewart Brodie's World Wide Web browser, *ArcWeb* version 0.19. This means we no longer need to have *TCPIP* (aka *KA9Q*) from the Internet Starter Pack running as well before surfing the 'net, and *ArcWeb* seems to run faster too. If I can do it, so can you!

Until other *FreeNet*-compatible clients have been produced, we'll still need *TCPIP* for the normal ftp, telnet, news and e-mail, and very good it is too for a combination package. But as parts of the *FreeNet* package are by Adam Goodfellow, one of the guardians of *TCPIP*, the setting-up of *FreeNet* has some familiar features.

Enquiring owners of existing Demon Internet accounts should have little trouble in getting to the same stage as I did. All I did was download the *FreeNet* archive from the Demon ftp server's *pub/archimedes/developers* directory, and substitute my own Demon account name and IP

address for Tom Hughes' account name 'compton' and his matching IP address in the various files.

I entered the IP address of the Demon gateway machine in the *Startup* file as described in the accompanying documents, and the name of the block driver, serial port number and Modem speed, copied from those in *TCPIP*.

This is probably not the best way to configure it, but it worked. I adjusted my *SlipDial* script to load the *FreeNet Startup* file instead of *TPCIP*, and ran *SlipDial*. When the Demon HELLO window appeared, I ran *ArcWeb* and off I went surfing. If you don't feel like experimenting, by the time you read this there should be a desktop utility available to ease this configuration process.

But don't whinge about things being complicated to set up. Isn't there any sense of adventure left about trying and succeeding to make a first contact? I remember the sense of triumph and elation years ago on my first successful connection to Archive BBS that it was actually me that was online.

UNLEASH THE ARTISTIC POTENTIAL OF THE Acorn Risc PC

ProArtisan 24 is the latest development in the hugely successful Artisan series. Designed specifically for the Acorn Risc PC, ProArtisan 24 exploits the enormous artistic potential offered by allowing the use of 16.7 million colours for image creation and display.

This means that the computerised tools provided, such as chalk, water colours and pastels, mimic their natural counterparts very closely. Add to this ability to load Photo CD images in full 24 Bit colour and what you have is an exceptional painting package for your Risc PC, with the added benefits of many powerful image processing tools.

A fact pack is available which includes a demo version of the software.

Price £169.95 inc VAT

Upgrade from ProArt 2 or 2CD for just £49.95 inc VAT

Upgrade from any other art package (including Artisan Series) £85.00 inc VAT

Acorn 💂

Coping with photocopies

A COUPLE of people have asked me about producing school newsletters on photocopiers and the problems they've encountered using photographs and grey scale images. Unfortunately, photocopiers are really designed for producing black and white images and your photocopies are not so good at representing shades of grey. Most

No of printable greys =
$$\left(\frac{printer\ resolution}{screen\ ruling}\right)^2 + 1$$

Figure one - a formula for calculating the number of greyscales available.

photocopiers suffer from an exaggerated form of dot-gain. Dotgain is where two separate adjacent half-tone dots join together to form continuous black areas rather than a fine half-tone screen grey colour. This results in the greys looking much darker and photos looking very dark with details being lost as they fill in.

In order to counter this effect, you should make your images paler and add as much contrast as you can stand (more contrast means less subtle shades of grey and more definition) by adjusting the brightness and contrast. Remember that though it may look pale on screen, it'll look a lot darker by the time it's been through the copier.

Screening resolution

Another thing to note is that a standard printer like the Canon BJ10e produces great grey scales at a screen ruling of 45lpi (lines per inch) - however, your photocopier is far less likely to fill areas in if you set the screen ruling a bit lower, say to 30lpi.

Most newspapers still use 30lpi screens for their photos. This helps prevent dot gain and also increases the number of discernible greys you can produce since the number of greys depends on the relationship between the resolution of the printer and the resolution of the screen ruling.

The screen ruling helps to define how many dots make up a half-tone cell. The more dots per side, the more grey scales the cell can produce. For example, a 4x4 cell has 16 combinations whereas an 8x8 cell offers 256 combinations. Therefore, a 360dpi printer with a ruling of 90lpi gives half-tone cells of 4x4, whereas the same printer with a ruling of 45lpi gives cells of 8x8.

Figure one shows how to calculate how many greys are available, so by altering the screen ruling from 45 to 30 we gain some extra greys that help improve the appearance of photos. To create a visually convincing halftone image you need about 150 shades of grey so a 30lpi screen is ideal for a 300 or 360 dpi printer.

Other printers with greater resolutions and different screening methods will obviously respond differently; however most copiers only have an effective resolution of 300dpi or thereabouts, so although your 1200dpi Calligraph printouts may look great, the copier won't be up to the task of reproducing such good results.

The only way of determining the best printer setting is to run the same bit of paper through your printer a dozen times, printing the same image on different sections of the page, using different half-tone dot settings and line screen settings each time. If you then photocopy this bit of paper you'll be able to tell from the results which settings best suit your copier.

A set of grey samples printed using this method would help you to relate the 10 per cent grey you see on your screen to the colour it produces when photocopied. This also works with images such as photographs; have one image in your document which you

move around as you feed the same piece of paper through your printer several times. If the image occupies one ninth of a sheet of A4, you can get 3x3 different images on the same sheet of paper to find the one that photocopies best.

Half-tone screen shapes

Another habit common to many photocopiers is that they respond better to certain types of half-tone screens (a screen type describes the shape and arrangement of the halftone dots). The Canon Turbodrivers provide six different screen types. I find the cross hatch and Dot Screen to be particularly good for photocopiers, but your copier may think otherwise.

Just as less dot fill occurs with lower screen rulings, the type of half-tone screen will affect the degree of dot fill. Figure two shows two different types of half-tone screen, and how they are made up from dots.

Figure two - two different half-tone screens with a dot and a cross-hatch pattern. The expanded views below the pattern show how the screen elements are composed of an 8x8 matrix of dots.

Games designers

GAMES designers seem to be all the rage at the moment, and after recently featuring an arcade games designer, this month I'm going to cover two brand new adventure game designers.

The two programs in question are John Fairhurst's MAD, or Micro Adventure and Andrea Gallo's Graphic Text Adventure Creator or GTAC. Both systems aim to fulfil more or less the same objective, which is to allow the user to create a text-based adventure which runs in an easy-to-use windows-based system in the desktop.

In both programs, script languages are used to create the locations, monsters and objects within a game and how the player interacts with them. Some programming knowledge is required, but if you manage a bit of

BASIC this should not present a problem. Both systems provide good documentation, with full tutorials and example games.

In fact, I couldn't really fault either of these programs, except to say that the inclusion of the scripts used to create the example games would have been useful.

Providing a direct recommendation in these circumstances is a bit tricky, and I'd advise anyone interested in the subject to have a look at both systems before embarking on the design of

Use GTAC to create your own adventures mixing graphics and text.

their adventure masterpiece. The only significant difference in terms of major features is *GTAC*'s support for graphics. Both sprite and *Draw* filebased pictures can be included very easily.

A slightly cut-down demo version of *GTAC* can be found on GA60 from Five Star, with the fully registered version being available for £7 or 15000 Lire from: Andrea Gallo, 237 Viale Cortina d'Ampezzo, 00135 Roma, Italy.

MAD can be found on disc GA068 from The Datafile.

TypeFind

The excellent *TypeFind* application, which was reviewed in last year's August issue, has now been updated to version 2.01. *TypeFind* allows the easy identification of the file types of any files which are not type stamped. *TypeFind* is Shareware and a registered version can be obtained for £5 from Ben Schofield, 24 Debdale Lane, Keyworth, Notts NG12 5JD.

ARM Club CD-ROM

Yet another source of public domain on CD-ROM is soon to be made available by the ARM Club PD library. After the success of the Datafile's PD CDs, the ARM Club will be launching its own CD for only £19.95 at the Acorn World show in October. Further information and the usual ARM Club PD service can be found at the ARM Club PD Library, 19 Woodberry Way, London, N12 0HE.

Public domain CDs have to be one of the main 'automatic buys' for CD drive owners, and this latest addition can only be good for the user. Let's just hope there isn't too much of an overlap with the material found on existing PD CDs.

PD Scheme

Following the success of Acorn User's PD scheme in highlighting some of the best Freeware programs on the scene, I can report the imminent arrival of several new utilities and games which will be appearing on the cover disc in the next few months. Development of Acorn User's QTM tracker player has also been in hand, with a major new release expected soon.

Contacting me

You can contact the PD page by writing to me, Paul Wheatley, at Acorn User, IDG Media, Media House, Adlington Park, Macclesfield SK10 4NP or (preferably) by e-mail to quantum@digibank.demon.co.uk or online on the Arcade BBS.

Five Star catalogue single-tasks

AS many of the other PD libraries have brought in desktop-based catalogue programs, Five Star has taken an alternative path with its single tasking viewer by Quintin Parker. Loading time is fast, and the application itself sits on the icon bar before exiting to single tasking mode when clicked on. The format is almost demo like, with a little scroll text and all interaction being icon based. All the usual features are there, including a fast search and the ability to calculate your order cost and produce an order

I don't think there's really much of a problem with the program being single tasking, but when browsing a catalogue I like the dynamic scrolling of RISC OS scroll bars. The Five Star program allows only fairly slow scrolling or a straight jump to the start or end of each catalogue section. That said, Five Star Marketing offers an interesting range of PD with many programs I haven't seen elsewhere. There are also a few exclusive budgetware programs and a good selection of bundled software packs.

Five Star Marketing Address: 4 Shepherds Walk, Bushey, Herts WD2 1LZ

The non-Desktop cataloguing program from Five Star Marketing.

Schools/ Businesses

Lease a Risc PC from as little as £43.50 per month over 3 years. Call for details.

Paying by Cash, Cheque, Switch, Connect or Delta?

You may deduct an

extra £35 discount

from the VAT inclusive price of your Risc PC!!

Well, almost! Ask about our exclusive new scheme which guarantees you can sell your computer system after 5 years for 50% of the price you paid.

Considering the rapid rate at which computers lose their value this is a remarkable offer - check it out now!

Business

Hintz for Colton userz

HERE are a few helpful hints for users of Colton's range of programs, which your business editor has found useful:

· Using a graphic in your letterhead will take up a considerable amount of disc space if it is embedded. To stop this, 'untick' the 'Embed pictures' option in the Choices window. Note, though, that the file will remember where the graphic is by its pathname, not by its relative position, so if you move the file to a different machine the reference will be lost.

Fortunately, you can re-find the graphic, and the program will not forget the reference when saved again.

- · Always have a copy of Minerva Software's Flasher on the icon bar as the z-family, quite correctly, does not flash its own cursor.
- · If you have been working on a very large document and then want to do something smaller, quit and reload your z-family program first. This is because they don't give memory back to the operating system; hopefully Colton will rectify this oversight soon.
- · Don't always rely on the 'Fit' option in the View Control window as this only fits to the nearest five per cent. It is often better to click on it and then up the number given

The Acorn User logo here is not stored within the file, saving on disc space, especially for multiple copies of the document.

by a few per cent to, say, 103 per cent.

- · If you have RISC OS 3.10 or 3.11, ask your local dealer for a copy of the latest version of the font manager as the one in ROM does not auto-kern letters as well.
- · Make use of the 'Print scale' option from the Page menu. This allows you to scale large worksheets taking many pages so that they are printed on just one page.
- · If you want to transfer data between Acorn and PC versions of the z family, it can be a good idea to make sure that any Draw files have had the text in them 'converted to

path.' By doing this it will not matter if there is not an identical typeface on the other machine. Keep sprites to an absolute minimum as the colours do not appear to convert properly. Don't use hard spaces in filenames as PCs don't particularly like them and remember to keep your filename to eight letters plus the extension /fwk (or /fwt if it is a template file). If you use sexed quotes, these will appear incorrectly when viewed and printed on a PC. Finally, don't set font widths as these don't function correctly when transferred between platforms.

Clan corner

I was most surprised at one of the results of a survey among Clan members. Apparently, out of the small percentage of members who had participated, over three quarters felt it was fair to pay for a technical hotline, with a system of charging for its use. I always check before purchasing software that there is no support charge.

Incidentally, I would recommend that readers do join the Clan as a number of software houses give discounts off their products.

> Clan Acorn Tel: (01223) 254448 E-mail: clan@acorn.co.uk

Really good displays

The Really Good Software Company's stand at the recent Acorn User Show showed that Notice Board, the company's presentation graphics package, really can produce good presentations. Since its launch last year, it has been given a major re-write and a number of new features have been added.

The package allows Draw or Artworks files to be cycled, though, accompanied by a good number of fades.

> The Really Good Software Co Tel/Fax: (01582) 761395

SQL for DataPower

The database market is continuing to hot up. The imminent DataPower 2 is going to feature a structured query language (SQL). According to lota, a considerable amount of the money from the Windows and Mac OS versions of The Complete Animator will go towards development of DataPower on the Acorn platform.

> Iota Software Tel: (01223) 566789

Contacting me

If you have any hints and tips for any business-related products, or you have some news to share, why not drop me, Alexander Singleton, a line at Acorn User, IDG Media, Media House, Adlington Park, Macclesfield SK10 4NP, or by e-mail to: alex@acornusr.demon.co.uk.

Confusing standard

OCCASIONALLY I notice something which seems downright illogical. I have observed quite a number of people getting really frustrated using a Risc PC simply because when some buttons on the keyboard are pressed, something else happens.

For instance, all PC users and I would expect the End key to move the caret to the end of a document. But no, it deletes the character to the right. Similarly, the Delete key actually does the same as backspace, whereas it should delete (i.e. erase the character to the right of the caret).

Acorn itself is not happy with this. The Acorn Style Guide (which was written before the Risc PC was born) confirms this. It says that 'in the future, non-proprietary PC keyboards may be supported' and goes on to say that the functions of the forementioned keys should change to the same as on any ordinary PC. Will the next release of RISC OS address this problem?

Making a professional **Impact**

INITIALLY confusing, Impact Pro from Circle Software actually provides a flexible database package at a very low price, once you have got the hang of it. The databases that Impact Pro creates look like any RISC OS window and reporting is done via Impression.

The package is relational (see the Business page, June 1995 for a definition and an explanation of why this might be useful) and at £65 + VAT, you can't really grumble. If you can afford it, Recordz might be a better bet, though this isn't a relational database.

Circle Software Tel: (01793) 770021

Power to perform

- · 8 SCSI icons on the icon bar.
- Double normal maximum storage from 2GB to 4GB.
- Ability to read to a device and write to another concurrently.
- Very fast. (Up to 5MB/sec.)
- Ability to read other manufacturers' partitions.
- Express (easy) setup as well as advanced setup options.
- Streamer software built-in.
- Ability to set read-only partitions.
- Multi-tasking low-level formatter included.
- Removable media, CD ROM and scanner support.
- · Ability to read DOS partitions.
- Auto termination option.
- Auto spindown facility.
- · Password protection.
- Flash ROM for easy reprogramming.

With the growing range of CD ROM drives, hard discs, and scanners available as SCSI devices, equipping your Acorn computer to harness the raw power of multimedia through the industry standard of SCSI allows the greatest long term flexibility. Designed to offer the highest data tranfer rates of the Power-tec range together with SCSI 2 compatibility the new *Power-tec SCSI 2 Card* offers leading edge technology at an affordable price.

Education

Information Technology for parents

HANDS up all parents who are concerned that their children are more IT aware than they are. Half of those who have their hands down are probably too ashamed to admit it, but there is now a solution which has been provided by Allister Duncan. In his work as an Information Technology co-ordinator and network manager, Allister discovered many parents wanted to know more about Information Technology, but there simply weren't the opportunities. So, working from his school, Allister began Information Technology for Parents. Aimed mainly at parents of children aged between three and 11 years, the cost of a course is £12 per person, which assures a computer each, or £6 each if parents share a computer. You do not have to

be a parent of a child at Allister's school to attend the course.

Parents will be able to use exactly the same kit as their children will use in school. The hardware includes a network of Acorn computers, some stand-alone Acorns, a scanner and a wide variety of printers. The software library donated by software houses looks very impressive indeed.

If parents have a couple of hours free on a Monday evening or a Saturday afternoon, give Allister a ring and book a course. Alternatively, a booking form is on this month's cover disc in Impression and text formats.

> Information Technology for Parents Tel: (0589) 284113 (day) or (01932) 563189 (evenings)

Dumfries agrees with me

THIS month, I'll unashamedly blow my own trumpet. In the last month's issue I was extolling the virtues of CSH's new CD-ROM The World of

Robbie Burns. Not necessarily as a result of reading that article. Dumfries has standardised on Acorn computers and has purchased over 100 Acorncompatible CD-ROM drives mainly because of the Burns CD-ROM. Apple? PC? Forget 'em! Acorn is the platform for education.

Help for organising school visits

TAKING children on school visits is an important part of their education. But as any teacher who has organised a trip will tell you, it can be a logistical nightmare, especially if the trip involves going abroad.

Creative Fortunately, Curriculum Software has come up with a product which may help. Trip is a program designed to ease the job of organising a school trip or outing. As well as allowing the organiser to record and print out passport details of students taking part, Trip allows all individual payments to be logged and printed out. With information about the deposit dates entered into the computer, the program is able to list

students with any balance outstanding on a particular day.

This program is also useful as a sort of checklist to ensure the teacher has done everything required like medical details, special diet etc. Trip costs £14.95 for a single user and £89 for a site licence.

Creative Curriculum Software Tel: (01422) 340524

This program from CCS will take away some of the chores of organising a trip.

Networks in education

Welcome to Bill Lamin who is **Director of Information** Technology at Pool School and Community College in Redruth, Cornwall. He also has some very sound thoughts on minimum hardware standards. Read his article and find out how to get special deals on upgrading your schools' computers.

More jargon

My comments about filer jargon in the April issue touched a raw nerve - almost as much as a previous broadside about clip art. Thank you to all those who responded with a wide assortment of fixes, all of which involved loading files/modules/ programs of anything between 6K and 42K! Not bad for one or two computers you might think, but 50+ computers all loading up an extra 42K across the network will add to the power-up time quite significantly. While I am grateful for these solutions, I still feel that these are problems which shouldn't need to be fixed because they shouldn't be there in the first place. Are you listening, Acorn?

On the cover disc is Russ Juckes' solution which places a 6K module called NewMsgs in System: Modules. Full instructions are included. I tackle the problem from another angle and ensure that each computer knows where each application is (or at least the important ones) by adding a few Filer_Boot instructions into the existing boot sequence. This is also included on the cover disc.

Apologies

Back in the April issue, I wrongly credited Kingfisher Micropedia to ESP rather than ESM, who actually sells the CD-ROM (although the phone number given actually was ESM's). Apologies to all concerned.

Contacting me

You can contact the Education page by writing to me, Geoff Preston at Acorn User, IDG Media, Media House, Adlington Park, Macclesfield SK10 4NP or by e-mail to GPreston@arcade.demon.co.uk.

Networks

NetView updated

SANJAY PATTNI'S NetView has just been revamped and is now compatible with the Risc PC. The program allows a user to view another user's screen and send messages to one, any, or all users. One apparently insurmountable problem is that you can't view a Risc PC screen from a non-Risc PC if the Risc PC is in a mode not supported by the viewing computer (for instance, if you're on an A5000, you can't view a Risc PC if the Risc PC is in a 32,000 colour mode, because the A5000 can't handle that mode).

Apart from that, the software is much faster when transferring screens across the network and sending messages to users. This is a very useful program for managers who control a network which extends beyond a single room. I frequently use it to view what a student is doing in another part of the school, then send a message to help the student solve a problem. It's also handy to send a message to all students on the network telling them it's late and you want to go home!

> Sanjay Pattni Tel: 0181-568 9167

Tip for the month

AS hard discs get cheaper and large capacity drives are therefore within the budgets of many more schools, ever increasing numbers of applications become available to clients. This, in my opinion, is a good thing, but some will find it difficult to wade through complex directory structures to load the applications they need. SEMERC's Front_End (see news last issue) is one solution, but is more suited to primary schools.

For older students, an answer may be found on the CD-ROM on the cover of April's Acorn User. In \$.AcornUser.Discs. AcornComp.Cover.9410. Reader.TidyClock is an application called TidyClock which includes a customisable program locator. If you're going to place this on the read-only area of the network, you'll need to prevent any attempt at saving the configuration because it will crash the program as it will be trying to save to a read-only medium. To do this, load !RunImage into Edit and search for

IF ms%=5 PROCsave_prefs

Change this line to:

IF ms%=5 ENDPROC

TidyClock includes a customisable program locator to ease the finding of programs hidden deep in a directory structure.

Tape or disc backup?

IT is the responsibility of the network manager to backup user areas regularly. What's best - tape or disc? This is a difficult question to answer briefly but, flying in the face of industry convention, I'd say disc. Certainly for schools, disc has two major advantages over tape. Firstly, it is much easier to restore the odd lost file at a moment's notice - as is frequently the case when a student has accidentally deleted a piece of work that's due to be handed in yesterday. Secondly, I can take the backups home to mark work.

I am, of course, referring to removable hard discs. I use SyQuest drives (one at school and one at home) and find that I can fit a whole year group onto a single 105Mb disc. However, it's not a perfect solution because backing up can be stopped if, for example, between two backups a student renames a file and then creates a directory using the same name as he or she previously used for the file. The computer will stop the backup with the message 'Can't create file as it already exists as a directory.'

Another problem arises from the computer encountering open files. This is usually caused by students not closing down a datafile correctly and just switching off. However, there are people currently writing software to solve this and other problems related to backing up user areas onto disc.

At the Acorn World exhibition in Harrogate, Cumana showed off its new drive. It's a Panasonic unit that will read conventional CD-ROMs, but is also capable of read/writing to a disc which looks similar to a CD-ROM, but is an optical disc. For the more technically minded, refer to Ian Burley's article on page 13 of the June issue. The whole kit, including SCSI 2 interface, will be less than £700, with additional 600Mb disc costing about £40. This should make an excellent backup device.

> Cumana Tel: (01483) 503121 Fax (01483) 451371

Elite

Author: Hybrid Technology

ANYONE who's ever been into games will know about *Elite*. It's the best-selling Acorn game ever, and those of us who spent the wee hours zapping evil space pirates and surfing the solar waves when it first came out will understand why.

Elite will work on any Acorn machine, even 1Mb RISC OS 2 machines. Full instructions are included in the *Manual* directory, which contains ten text files which, together, make up the game manual. Here we concentrate mainly on flying your ship, which is skimmed over in the manual. There's also a keyship for the game supplied as a *Draw* file, which you can print out and use.

The text file *ILoading* gives full information on loading the game, changing preferences and saving commander files, but for now you can just run *Elite* by double-clicking on the *élite* application, so it installs on the icon bar. Those with RISC OS 2 will need to make sure their system folder contains the *CLib* module provided in the *System* folder on the disc.

Those with Falcon Analogue Joysticks can use them with this version of *Elite*: details can be found in the *Falcon* directory. *Elite* can also be used with the standard joystick ports on the A3010.

If you have a Risc PC then *Elite* will run, but it will be faster than normal. *GameOn!* from The ARM Club sorts this problem out, as well as fixing loads of older games to work on the Risc PC: you can contact them on 0171-624 9918.

Playing Elite

Elite is set far in the future, when eight galaxies have been colonised by the Galactic Co-operative. You have just passed your space pilot's exams, and when you start the game you are sitting in your ship – a Cobra Mk III – in a space station, orbiting the planet Lave.

In *Elite* you can fly your ship around, firing at anything you see, and jumping through hyperspace between planets in the galaxy. As all this costs money for fuel and so on, you need to make money by trading goods between planets: each planet has a different stock market price, so you can make a tidy profit – or loss – by trading commodities. As you earn more money, you can buy more equipment for your ship – such as better combat lasers, fuel scoops and so on – and so improve your effectiveness in combat.

At the end of the day, the object of *Elite* is to destroy so many enemy ships that your rating goes up to *Elite*. Initially you are given the rating *Harmless*, and as you destroy more and more ships, asteroids and so on you progress through *Mostly Harmless*, *Poor*, *Average*, *Above Average*, *Competent*, *Dangerous*, *Deadly* and finally

Figure 1: Flying your Cobra Mk III

Elite. Don't be fooled: to get to Elite rating requires months of dedicated play, but there's so much to see and do on the way the journey is worth it.

Flying your Cobra

When you first load the game and click on the *Elite* icon, you are presented with a swirling mass of stars – click once with Select to enter the game proper. You can now see your status displayed: this shows where you are and where your hyperspace is locked onto (Lave), the fact that you are docked, your fuel (seven Light Years), how much money you have (100 credits), your legal status (Clean) and your Combat Rating (Harmless). As you progress through the game these values will all change, as will the equipment listed at the bottom of the screen.

At any time in the game you can return to the Desktop by pressing F12 or clicking on the DESK icon – try it now. To return to the game just click on the *Elite* icon and you'll be back where you were before pressing F12.

First, let's try some flying. This takes some serious getting used to, so don't expect to be competent for some time. Before doing anything, make sure your Caps Lock light is lit on the keyboard – if it isn't, press Caps Lock). This switches on 'damping mode' (don't worry what that means) and makes flying much easier.

To leave the space station, press F1 (or click on LAUNCH). You will fly through a tunnel, and come out into space: don't panic! Start by pressing the middle mouse

button until your speed – shown by the SP indicator on the top-right of your controls panel – is zero. Now, you're hardly going anywhere, so you can't crash.

Take a look round your controls, as detailed in Figure 1. One of the most important navigational controls is the Compass, located next to the speed indicator. This shows the position of the space station (if you are within the space station's safety area, shown by the S at the bottom of your control panel) or the planet (if there is no S). If the dot in the compass is white, then the station is in front of you, and if it is red it's behind you.

The position of the dot within the compass shows if it is to the right, left or whatever. Try rotating your ship so the dot is white and in the middle of the compass: you should see a Coriolis space station right in front of you, silently spinning against a backdrop of stars. Now try rotating yourself so the dot is in the middle, but is red, and then press F2 to look out of the back of your ship. There's the station again.

Now press F1 to go back to forward view, and experiment with moving around. The right mouse button speeds you up, and the middle one slows you down. This is a good time to experiment with your 3D scanner. If you crash into the planet (you'll know if you're getting closer because the AL reading will go down) or the space station, you'll die, but don't worry, there's plenty of time for practice. By the way, the left mouse button fires your laser: try it out, but if you fire on the space station, it will send out loads of police to get you...

What next?

Trading is covered in detail in the file 7Trading, and flying between planets by hyperspace is covered in 3Cobrall1. You can only buy and sell when you are docked, and you don't know prices until you have arrived at a planet, so you're not guaranteed a profit until you've actually done the trip.

If you want to get into the game more quickly, without doing too much trading, then the commander file *Gisburne* has

more credits and a high combat rating. To load this, just double-click on it in the Desktop, and then click on the *Elite* icon as usual.

When you've tried a bit of flying, and maybe a bit of hyperspacing, do read the manual through. It contains a lot of little clues which are invaluable later on in the game when you are set missions to prove your worth. Next month we'll let you into a number of secrets about the game, but in the meantime, happy shooting!

A well-equipped ship is an essential in any combat situation. Buy with the Adjust mouse button, sell with Menu.

Disc information

ELITE is not the only program on this month's disc – our regular features and the final part of the Internet Starter Pack appear as well. More details about these can be found in the !Help files on the disc, and in other parts of the magazine such as the C for yourself article and *INFO.

The majority of our survey responses suggested that readers wanted more software packed on the cover disc. In order to do this, we have removed the *Menu* program.

RISC OS 3 users will be presented with the usual display of icons; they can open the archives by double-clicking upon them (this is the

equivalent of the 'View' option in the *Menu* program). To get help on an archive, RISC OS 3 users should choose Help from the App. 'Appname' submenu obtained by clicking with Menu over

the archive icon. RISC OS 2 users will have to work slightly harder. They should first run ArcFS to uncompresses the data in the archives. Double-clicking on an archive will open it, revealing a !Help file, a !Run file, a !Sprites file and a directory containing the archived data. Loading the !Help file into a text editor will give information on the archive contents. Elite will run on RISC OS 2, as will many of the programs in the *INFO section.

If your disc is faulty, then you should either return it to TIB, TIB House, 11 Edward Street, Bradford, Yorkshire BD4 7BH (if it does not verify or is damaged) or to the editorial office at *Acorn User* (if it verifies). The *Acorn User* cover disc has

been checked for viruses using *Killer* version 2.002 from Pineapple Software.

'Science and technology are subjects for anoraks and brainboxes, closeted away in laboratories and out of touch with the real world. Discuss.'

f you're reading this, then the chances are you're an owner, or at least a user, of a computer. You're in touch with modern technology. You can probably work out how to program the video. But I'll bet that even so, there's a little voice, deep inside you that says either 'Technology scares me' or 'Science bores me', or both. If I'm right, then you'd better pay attention, because if you believe science is just for some cloistered elite, I have news that could change your life. As of 1 May 1995, the new building for the Techniquest science centre in Cardiff is open - and visitors are welcome to touch, fiddle and toy with every exhibit on show.

Go there. Even if you're one of the hundreds of thousands of schoolchildren in Wales and England to have experienced a school outing there already, or one of the grandmothers who reputedly said 'We must come back without the children!', go there and enjoy a satisfying day of tinkering and enlightenment. Techniquest is far too much fun to squeeze into less than a whole day's visit.

Acorn-controlled exhibits

It's not surprising, at least not to seasoned Acorn users, to learn that many of Techniquest's hands-on exhibits incorporate RISC computers and controllers. Let's face it - if enabling people is the goal, there can't be another source of computer technology to perform the task in hand quite as easily and as well as Acorns can.

This is a heritage from the BBC computer, with its versatile array of input and output facilities, and indeed Techniquest still uses Beebs and Arthur - the operating system which preceded RISC OS - for a couple of its exhibits, although the bulk of the computer-based demos use models ranging from Arcs and A3010s through to the Risc PC. There are two categories of computer exhibit: those which are about

ACOR

Techniquest Exhibits Director Harry White contemplates the well-known problem of the leek, the sheep and the dragon. This exhibit is run by an A3000.

computers and what they can do, of which there are few; and those which use a computer to give the visitor an experience they could not otherwise have had, of which there are several. In the latter cases, it is the experience itself which is vital, and the presence of a computer may indeed be completely transparent to the

Computer-based exhibits can be particularly alienating, especially for adults, who fear that this is expensive equipment they might break. So Techniquest's computer exhibits are made hardy by hiding

the keyboard and replacing the mouse, where needed, with a trackerball and up to three push buttons. In some cases a concept keyboard is used instead, but always the individual exhibit is custom-designed with its own appropriate user interface.

Tree surgery

So what do these exhibits actually do? Techniquest's first ever computer exhibit in 1986 was called Design A Tree. This was conceived by Techniquest Exhibits Director Harry White while Techniquest was in its first phase, and was used with a lightpen on a BBC micro. The current version runs on an A5000 using a customised keypad on an IIC interface card. The visitor is able to choose six parameters which influence the growth pattern of their tree, then hit the 'Grow' button and see the result. Essentially it is an exercise in fractals. Harry is fond of this exhibit, which he says 'combines art and science in a meaningful way'.

'It's rewarding when you speak to people a while after they've used this exhibit, to find that they now look at trees and confess to analysing them in terms of "branch angle" and so on,' admits Harry.

It is also a good example of why

The history of Techniquest

The fun has been going on for about ten years, and was set in motion by Professor Beetlestone, now Techniquest's Director, but formerly Professor of Science Education at University College, Cardiff. Since its early days, borrowing space in former Gas Board showrooms in central Cardiff and funded by a grant from the Gatsby Charitable Foundation, to the opening in May this year of spacious, light new premises on the quayside at Pier Head, Techniquest has seen some 700,000 visitors pass through its doors - more than twice the population of Cardiff itself.

Funding for the new building came from the European Regional Development Fund and the Welsh Office. The new structure provides around 32,000 square feet of floor space, including over 160 hands-on exhibits, a science theatre, education laboratory, planetarium, discovery room and information centre, restaurant and shop.

The full story of Techniquest's progress from a short-term project to a profitable educational charity describes a mission of sorts; a labour of love for all those who have been involved. The secret of Techniquest's success is that it is fuelled by a powerful philosophy: its aim is to overcome the public's sense of alienation from the cold, hard world of science; its message is educational, not in a purely didactic sense, but in a way that enables people in an increasingly technological society.

Take the example of Molly Parkin, the writer and broadcaster, who visited Techniquest in its early days and later reported that she felt sufficiently enabled to change the bag on her vacuum cleaner for the first time. This was not because she had seen an exhibit which instructed her how to do this, but because her visit had made her feel that such a task was within her grasp.

Kathy Brown visits Techniquest's new hands-on science centre in Cardiff, and finds Acorn machines are helping to bring people and science closer together.

nobs on

computers are needed at all at Techniquest, which has a vast number of entertaining and informative exhibits structured from purely mechanical resources, which some might consider to be ample. But imagine trying to conduct this experiment using purely biological material: you'd be there forever. Design A Tree allows experimentation and displays results in a very short space of time, something that simply could not be achieved using the real thing.

Robust technology

Designing and developing the exhibits to be effective and attractive can be a long, complex task. Harry White explains that getting a program to work is roughly one third of the development process, with the remaining two thirds devoted to perfecting the user interface. This can be an ongoing exercise, and it is generally said that a new exhibit is not finished until it has been up and running and working on the exhibition floor for three months. Harry quotes Sir Clive Sinclair on the Spectrum: 'Of course they're unreliable, they're subjected to the most destructive force known to man: 11 year-old boys!' But unlike Sinclair's classics, Techniquest equipment does not have a reputation for being unreliable. Everything on display must be working. If it isn't, it is removed straight away.

Harry restates the Techniquest philosophy: 'If an exhibit is broken the visitor will initially blame himself, saying "I never could get on with science, even at school." If more than one exhibit in the 160 is not working the visitor will go home saying, "Half of them were broken anyway!" Obviously, this would negate the whole *raison d'être* of an establishment like Techniquest, striving for a rapprochement of Mr J Public with the broad spectrum of scientific disciplines.

The range of subjects embraced by Techniquest's exhibits is astounding.

When you think about it, science and technology are interwoven with a whole host of other subject areas. Take Media, for instance. The *Out of the Blue* demo is an idea borrowed from the Museum of the Moving Image in London, allowing participants to see themselves on screen, superimposed onto a video image of a flight around Cardiff Bay, just like Superman, simply by standing in front of a blue background. This uses an A3010 with four IIC interfaces to control the effects and a Risc PC with Computer Concepts' *Movie Magic* card to play MPEG compressed video from a CD-ROM.

Also falling within this category is the hands-on DTP demo, which allows visitors to try their hand at desktop publishing with a Calligraph direct drive laser printer to provide a fast printout for the user to take away. Or consider statistics: *How Many*

The reaction timer exhibit. The Archimedes display with its scalable anti-aliased fonts is perfect for exhibits like this.

Like Me? asks the visitor eight questions about themselves and records the data, then presents the user with statistics showing how many people share their characteristics, finally calculating how many visitors with exactly the same combination of characteristics have used the exhibit.

The implementation of computer technology has led to the development of some very entertaining exhibits. Remember the old logic problem of getting the fox, the rabbit and the lettuce safely across the water in a small boat? Techniquest has brought this to life with a Welsh dragon, a sheep and a leek. As you are probably aware, dragons are predators of sheep and cannot abide eating leeks. The visitor is encouraged to attempt various permutations, placing models of dragon, sheep and leek into appropriate slots either side of a 'river', with sound

The latest implementation of the *Design a Tree* exhibit uses fractal mathematics not just for the tree, but for the landscape and clouds as well.

TECHNIQUEST

effects generated by two A3000s hidden below the platform which detect and indicate when one participant is about to have the other for supper.

One of the displays in the new building is called *Powers of Ten*. This is Harry White's latest 'baby'. 'For a long time I have admired the book and film *Powers of Ten* by the office of Ray Eames and Philip and Phyllis Morris,' he explains. 'It is a sequence of pictures starting at astronomical size with clusters of galaxies, coming down by factors of ten to an image of Earth, then a specific continent, country, region, building, person, person's hand, cells in their skin and so on, down to atomic dimensions and pictures that look surprisingly similar to the galactic ones with which we started.' Sounds a little like an advert for Irish stout. There are 42 steps from 1025 to 1016. Techniquest has developed this display using a Risc PC with its own sequence of pictures on CD-ROM so that the user is in control and can zoom in or

Help from the market

Harry has words of gratitude for various companies in the Acorn market: 'We've been very lucky to have Uniqueway so close. They've helped us get our CD-ROM exhibits sorted out. Barring a few hic-coughs involving white book-compatible CD-ROM drives, that's gone really smooth-Irlam Instruments has been good, too. Its digital signal processing card has exceeded our expectations, and we've got a 24i16 card to play with.' Not forgetting Acorn itself, who got Techniquest started

in 1988 with a gift of half-a-dozen ex-demo BBC Masters and a Domesday system.

'I was already pre-disposed towards Acorn because of the ease of interfacing the BBC, plus the speed of BBC BASIC. When you think back to the Commodore PET and Apple 2 and what you were having to program in those days, it's absolutely terrifying!' Harry insists that Techniquest could not have developed the number of exhibits it has in the time given without using Acorn machines. He feels that sourcing items from the PC world would be more impersonal, more expensive, and, he fears, result in equipment of lower quality. In the Acorn industry, he gets to speak to the developers them-selves, and the software interfaces to the cards are generally easy to use.

This is important as it helps bring new exhibits through the painstaking process faster, which takes a demo from concept, through design and implementation to full operational status. The three influential factors remain the ease of programming, the inherent speed of the machine and the basic degree of common sense with which the Acorn is sal in the computer world,' Harry

put together: 'which is not univer- Break the light beams, and the Archimedes obligingly plays the appropriate note – eat your heart out, Jean-Michel Jarre!

Harry is indebted to fellow programmers Roland Cleaver and Joshua Goodall who have worked on

acknowledges. 'The Apple font system, for example, is a nightmare.

This is a recurring sentiment on the professional scene: wherever customised practical applications are required, Acorn and the RISC processor score highly because of their versatility, speed and ease of programming. And if ever this were in doubt, a trip to Techniquest should give you the evidence you need.

It cannot be stressed strongly enough that Techniquest is a fantastic experience for everyone. It has been quoted as 'A marvellous place for all the family to play and learn together.' It is not a showcase for Acorn computers per se, but a splendid example of the practical application of Acorns – and from Techniquest's point of view the most important message that you'll take with you will be this: science is fun!

124 CAMBRIDGE SCIENCE PARK, MILTON ROAD, CAMBRIDGE, CB4 4ZS TEL: (01223) 425558, FAX (01223) 425349 abba dabba doo, I'm king of the jungle too! Why, you might ask? Well, I've just spent the last couple of weeks making moving pictures on my Acorn computer.

Quite simply, animation in the traditional sense relies on an initial 'great idea' developed into a series of freehand drawings, each slightly altered, so that when they are placed sequentially (as in a flickbook) and displayed, there is an illusion of movement when viewed. Computers are the ideal medium and time-saving device for the animator because an original drawing can be copied, altered, saved onto disc and then played back on the screen.

Two software packages treating animation in completely different ways are Iota Software's *The Complete Animator* and Minerva Software's *Prime Mover*. So it's lights, action sound and here we go.

The Complete Animator

It is no boast that this is a 'complete' animation package

in every sense, concealing a whole wealth of sophisticated but user-friendly features underneath its excellent user interface.

In fact what you are really getting for your money is an integrated creative suite of drawing, sound, text and animation tools. Even the excellent guidebook and video supplied with the software are designed to introduce animation as a fun activity, without being too technical. This approach will win the team at Iota many friends.

Getting started

Once loaded onto the icon bar the software positively encourages you to experiment, and more importantly you don't need the book to begin with.

Right from the start, The Complete Animator can be configured to suit your own preferences using Choices which include Standard, Junior or Custom options. There is even a set-up box for a Genlock board so that your animated masterpieces can be recorded onto videotape. Create allows you to adjust the size of your film, which is set as a quarter of the screen by default. Grabbing from scanners or the screen is also available here.

Key features

The Toolbox is the vertical column of easily recognisable icons down the left-hand side of the viewer screen.

Each one has a

clear specific use. For example you use the Pencil and Paintcan, with the help of the useful Eraser, to design your ideas on the viewer screen. A Snapshot (camera) is used to capture areas of the screen, or directly from other applications such as scanners or digitisers, and the Stamp Picker can be used to flip, resize and rotate your cutouts. The stamps also contains some excellent pre-loaded pictures including background scenes, astronauts, walking legs, mouths and speech bubbles. The Text tool can be used to create titles for your work.

The Play tools at the bottom of the viewer screen control the motion of the film including forward, rewind and speed (shown by a slider bar with a tortoise and hare symbol!). Frames can easily be duplicated and added, and a 'film strip' shows the frame number currently being viewed – this can be smoothly dragged backwards and forwards with the mouse.

In-betweening and Ghosting buttons give you the opportunity to view three consecutive frames as if they were drawn on tracing paper, a very useful design aid. There is even a range of fade options available including slides, wipes and slats, which are excellent for those subtle changes from image to text.

Films can be created in any screen mode from two colours to 16 million, and can be saved

The Complete Animator's main window

capers

Pete Worrall looks at two packages that'll bring out the Walt Disney in you.

in Iota, Ace, Replay and sprite format; the soundtrack can even be saved separately if required. There is also an excellent Print option that arranges all your frames neatly on one page, which can also be saved in *Draw* file format if required. So now you can produce your own customised flick-books from your printouts.

The Sound Picker not only lets you listen to all the wonderful sampled sounds already available, but also gives you the option to drop them into the viewer screen to add that extra dimension to the animation. You can create your own sounds by either dragging in sample files or by using an Oak Recorder. Sound editing facilities are included for controlling the length, stereo position, pitch and volume of each sample. Using sounds adds that extra dimension to your films and is a brilliant introduction to multimedia.

Practical uses

The Complete Animator can be used for a wide range of different purposes, at home, work, or in the classroom, and is suitable for all ages. It is ideal as a multimedia tool and can be used to create instructional films to fit a whole range of different purposes.

It makes you think about the animation process by combining art, sound and animation together. This is an exciting learning experience. What more can I say: it is the definitive animation package for Acorns.

You can save your film out as sprites in a *Draw* file from *The Complete Animator*.

Prime Mover

Prime Mover is an interesting animation package, based on sequential sprites moving in real time along a path set against a backdrop picture. The software and rather too-technical guidebook assume that you are familiar with both the Acorn environment and more than the basics of animation, but it does support Acorn's interactive Help application.

Before you start, it is worth loading the demo film showing a walking man and flying butterfly. This explains the principle on which everything moves.

Getting started

To begin with your ideas must be worked out in a paint package. Firstly, consider a starting

Comparison table The Complete Animator

- Flick-book animator with a comprehensive set of art and sound tools.
- Includes a colourful, clear, descriptive guidebook and instructional video full of ideas.
- Animation is frame based with a range of special effects such as fades and wipes.
- Films can be saved in Replay, lota, Ace and sprite formats and all the frames in the film can be saved and printed as a set of *Draw* files. The sound samples can even be saved.
- Clear toolbox interface with large selfexplanatory icons.
- Plenty of scenes, faces, walking figures and films included with the software for you to play with.
- Film speed is controlled simply by slider bars or, more accurately, through the menu.
- Intuitive animation software for all seasons and age groups.

Prime Mover

- Sprite animator, but you must design your sequence in a paint package beforehand.
- Guidebook is comprehensive, but rather too technical and fails to describe the animation process clearly.
- Animation is very smooth, defined in terms of time rather than frames, and is played back in real time lasting from five seconds to many hours.
- Films can be saved as a Prime Mover file, Ace and sprite format.
- Rather complicated interface with too many small unclear buttons.
- One demo film is included with the software with a limited amount of data.
- 7. Extremely accurate timing and movement facilities.
- 8. Rather inflexible animation software, but works well with digitised images.

point: perhaps a drawing of a butterfly with the wing in different positions, or a figure walking.

This requires practice, and perhaps a few preparatory real drawings in a sketchbook is a good idea. As long as you end up with three movement sprites plus that all-important backdrop all saved onto disc, you are ready to begin using Prime Mover.

Key features

The Main Film window (for animation playback) and Time Ruler window appear when Prime Mover is selected on the icon bar. Sprites can be dragged into the Main Film window, but make sure they are clearly numbered: backdrop, fly1, fly2 and fly3 for example. They are stored in the Film Sprite window in preparation for your animation. Here you can edit the sprites in different ways including creating transparent masks (useful for moving objects), rotating and trimming. It also allows sprites to be exported back into an art package if required.

Sprites can then be dragged from the Film Sprite window into the Main Film window. Now comes the clever bit: another window called the Film Animate window turns your series of butterfly sprites into a moving animation. To do this you select the sprites required using the Adjust mouse button and drag them into the Film Animate window. After typing in a filename, your butterfly or fish starts to move in a small window. These moving pictures are

Prime Mover allows you to design a path for animated sprites to move along.

referred to as 'animates', and can be saved separately and used in different films. Drag your clever moving image onto your backdrop in the main window and you can now set a path for it to move along.

The button bar controls are visible above the main film window. Red square markers in the display show the positions of each of the objects at different times in the film. Blue lines can easily be created in between the red markers to denote the 'paths' the objects will follow (called motions). Circular red markers can be created for changes in direction, called a 'step' in the manual. So basically, the square markers finish the motion and the round markers are the intermediate ones that can be edited. Once your path has been designed, press play and hey presto! Your animated sprite will glide across the screen. This is the exciting bit, but it does take a little while to get there.

The Film Ruler window is always visible at the bottom of the Main Film window and contains small green time markers and red markers indicating when a selected motion begins, ends or changes direction. These can be adjusted to suit your time or movement requirements. The animation playback is incredibly smooth and realistic so that in the demo film the man walks across the screen pursued by a butterfly. The final film can be saved as a Prime Mover film, or as an Ace film for anything up to five seconds long; after that it consumes a fair bit of memory.

Practical uses

Prime Mover requires a certain amount of forward planning before it's up and running, and it is a pity the guidebook does not explain this more fully. There are certain assumptions made regarding the skill level of the user, and I certainly would not describe it as 'an animator for all ages and abilities'.

Films created basically contain moving objects following a path within a backdrop. While I did not find cartoon animation particularly exciting using Prime Mover, it is good fun floating digitised images on top of one another at different speeds. These results were both arty and experimental and could be downloaded onto video tape through a genlock board. If you have patience you will find that Prime Mover is a unique package and I am sure it will win friends in some quarters.

Prime Mover's Film Sprite window holds all the sprites used in an animation.

he only two contenders in the top-end desktop publishing market are Ovation and Impression, and for most people Impression has had the edge ever since it was re-released as Impression II some years ago. Ovation has always had a sound following, but since the release of Impression Style and Publisher it has been, effectively, behind.

You will be glad to know, then, that Ovation Pro is a completely re-written version of Ovation, and when it is released it will offer a significant number of advantages over Impression Publisher, though some important features are being saved for a second release. Beebug is aiming Ovation Pro at Publisher users, and is even planning a similar price tag, around £165, but a final comparison will, obviously, have to wait until Ovation Pro is released. What can be said, even at this early stage, is that Ovation Pro will give Computer Concepts something to think about if it is to remain the market leader in Acorn desktop publishing.

The user interface

The first thing that strikes you about Ovation Pro is that the user interface has been thought out from scratch. Along with your standard document window are three attached windows: the toolbox, which at first glance looks a bit like the one in Draw; the info palette, which is initially attached to the bottom of the main window and contains familiar items such as alignment buttons, local effects and font names, though the information shown changes depending on what tool is selected in the toolbox; and the button bar, which is positioned inside the top of the window, like Impression's tool bar, and has various buttons for save, cut, paste, undo and so on.

The toolbox and info palette can be moved around, a bit like the toolbox in ArtWorks, and can even be made to stay fixed. The button bar is always present at the top of the main window (assuming

Frame creation is very flexible, and you can have rotated text, multiple columns in frames, and irregular frames.

pplause

Ovation Pro's range of effects is very comprehensive indeed, and all effects can be used in styles.

you want it to be shown), and you can customise exactly what appears on it. The most obvious application of this is to tailor the package for use with children or classes, but the way this customisation works is quite amazing, and shows just how well thought-out the design of Ovation Pro really is.

Each button is given a name, a function and, optionally, a sprite. The function can be anything from a whole language which is built into Ovation: it's a bit like C, and is very easy to use.

You can do exactly the same with any keypress - so you could define Ctrl-Shift-A to insert your address, if you wanted and you can define any keypress to 'perform' another keypress. The upshot of this is that if, for example, you don't like

that fact that F3 brings up a save box, you could define Ctrl-S to do this instead. Interestingly, this enables you to produce a keymap file that will make Ovation's keys the same as Impression's - or, indeed, any other package's - so reducing the already shallow learning curve considerably.

Creating pages in Ovation Pro

Ovation Pro is a framebased desktop publisher, which means you have to create frames into which pictures and text can be

placed. Frame creation in Ovation is more flexible and powerful than any desktop publisher I have ever seen.

Both text and picture frames - no distinction is made when creating frames - can be rectangular, elliptical or polygonal, and the shapes remain fully editable throughout, even when text or pictures are placed inside. The nearest parallel in the Acorn world is drawing objects in Draw: frames act just like closed paths in Draw, so points can be moved, added and deleted; bezier curves can be created.

and edited; and line segments can be converted between curved and straight. There are almost no limitations to the shape of frame created.

As if the frame editing features weren't flexible enough, there are two more 'frames' associated with each frame, namely the inset and the stand-off frames. These define how text is repelled on the inside and outside of the frame respectively, and most of the time you can leave these frames alone, instead setting inset and stand-off to be a uniform distance inside or outside the frame. However, these frames can be edited, so you can repel text in exactly the way you want on both sides of frames.

You can also rotate, re-size and move frames easily, but the advantage over Impression is that you can rotate text frames as well as picture frames: the text rotates with it and remains totally editable. In fact, Impression can only create rectangular text frames, whereas Ovation can create any shape of text frame you want, so this is one area where Ovation has a definite edge. Another useful advantage of Ovation is that you can select more than one frame - by dragging a box over a range of frames, if you wish - but you can still change attributes such as the border and background colour, which is impossible in *Impression*.

Text frames can also be defined to contain more than one text column, with variable guttering between columns. This speeds up the automatic creation of newspaper-type layouts considerably. Another useful drawing feature is the creation of

for thought

Beebug is nearing completion of its latest desktop publisher, Ovation Pro. Mark Moxon took a look at a late alpha version, and liked what he saw.

lines, something *Impression* still doesn't do. These can be created in exactly the same way as frames, but don't have to be closed, and are most useful for creating arrows and gutter lines.

Text, styles and effects

Ovation Pro implements style attributes – bold, italic, alignment, font and so on – by using local effects, and by using named styles. For those who aren't familiar with this system, a style is simply a collection of effects – bold, Trinity text at 12pt, for example – that is given a name and is applied anywhere within the document. If the definition of that style is changed, then all the occurrences are updated to reflect the style's new definition.

Ovation scores over Impression in a couple of aspects. In both packages a style

can be applied to selected text, or it can be defined to apply itself to entire paragraphs. However, in *Ovation* you can also define styles to apply to words, with obvious advantages. Another good point for *Ovation* is that anything you can define in a style – rule offs, reverse text and so on – can also be used as a local effect, which is not always the case with *Impression*, notably in paragraph spacing.

The info palette is the easiest place from which to apply effects, but it does a lot more than show what effects are in place, like *Impression*'s. The palette is context-sensitive, so it changes depending on what is being edited.

There isn't much to say about styles and effects: both *Ovation* and *Impression* have a similar range of effects and a similar style system, though *Ovation* includes text skewing and rotation, plus more control over underlining. *Ovation* also has the advantage that all the effects can be accessed from one dialogue box.

Other features

- Spelling checker and thesaurus.
- · Drag and drop text editing.
- OLE support.
- · Built-in Chars application.
- Single shift font change: press F10 to shift the font to your choice for one character, useful for Dingbats characters.
- Retro-active master pages: change the master page, and it changes in the document.
- Virtual memory handling large graphics using in-house OPI.
- Uses dynamic memory so documents can exceed 32Mb.
- Show invisibles like carriage returns and tabs.
- Ruler guides for accurate aligning of frames.
- · Page grid for accurate frame creation.
- Frame border width can be specified.
- Frame linking can be edited easily.
- Snap to frame, ruler guides or page grid.
- Embedded frames.
- · Text and picture import filters.
- Supports interactive help.

Multiple undo

Ovation has one huge advantage over Impression – it has an undo facility. It is a multiple-level undo, the depth of which depends on a user-defined memory setting

for the buffer, and it works well. Anyone who has used Impression much will appreciate how useful undo and redo are.

There's also a complete colour system, with named colours, tints and so on. There is even a Pantone-like system that is user-definable.

Ovation also has a pasteboard at each side of a page so you can move objects off and onto the page at will, like in ArtWorks. Its size is

definable and, of course, it doesn't affect the printout.

Word spacing can be controlled more effectively than in *Impression*, and its use is like in *Quark*. You can tell *Ovation* how small it can make spaces between words, and how to spread out words and spaces to fill justified columns, even to the point of spacing entire words across columns.

There is a sophisticated bulleting system, too, which enables paragraphs to be numbered automatically as part of a style. It's more flexible than *Impression*'s 'initial and subsequent' numbering system.

Conclusion

I could go on all day about the features *Ovation* has which no other package can provide, but the box opposite sums up the most interesting and useful features. Its specification is certainly impressive.

One feature which might not make it into the first release is colour separation, which would rule *Ovation* out for anyone working with CMYK or spot colours. However, Beebug fully intends to add separation, though whether this will be as part of a more expensive top-end product is undecided.

Whatever your DTP needs, consider *Ovation Pro*. Judgement must be reserved for a full review of a finished product, but at this initial viewing, it looks very promising.

A fter a fair amount of hype and a great deal more rumour, Acorn has finally released an interpretation of the C++ language. It comes together in a package that contains a new version of its previous C compiler and Desktop assembler, as well as the brand new *Toolbox* and a whole batch of Desktop development utilities.

The package is supplied on six discs and comes complete with four manuals covering C and C++, the assembler, the supplied Desktop tools and finally, the technical details of Acorn's Toolbox. They're not ring-bound, but this came as somewhat of a relief to me since my reference manual for Desktop C fell apart on a regular basis. The system requirements of the package are four megabytes of RAM, a hard disc and RISC OS 3.10, so they're slightly more demanding than those needed for Desktop C.

By the CFront

I'll start with a look at the C++ compiler - perhaps the most obvious addition to the development package. Acorn's compiler is a port of version 3.0 of AT&T's CFront product; what this means in practice is that you're getting a translator which converts your C++ code into the C equivalent. A few features aren't yet implemented, including exception handling, but CFront has a good history on other platforms - it was written by the original creator of C++, Bjarne Stroustrup. There are few differences in operation between the C compilers - you'll notice that C++ takes longer to compile since it's pre-processed and translated into C before being treated in the normal way.

Looking at the title of Acorn's product, it seems likely that C++ is one of its major features – however, all you get in the way of examples are two *Hello World* programs, one of which has an intentional bug in it. All the major examples are written in C, so you're pretty much on your own. I can understand why the manuals don't contain tutorial sections – a good tutorial would be another manual in itself – but I

ACO
Steve Mumford
reviews Acorn's
latest Desktop
development

would have liked to see several more C++ examples included on the discs.

package.

Searching through the Toolbox

The most exciting feature of Acorn's development environment is a set of resources referred to as the Toolbox; it replaces the RiscOSLib library supplied with Desktop C and is supported by two new resource editors. The Toolbox is implemented as a series of modules which act as an interface between the WIMP and your own sourcecode. Because it consists of a whole host of SWI calls, you're not limited to writing your programs in C; it's equally possible to write them in C++ or BASIC.

Once it's been set up, the *Toolbox* is capable of automating many of the procedures that proved time-consuming in the past, such as menu handling and window generation. It communicates with your code by way of events, so after a handler has been written for a particular circumstance, you can leave the *Toolbox* to listen out for the appropriate message – when the event occurs, it will automatically call the function you've assigned.

In the same way that the FormEd utility allowed you to design window template files for inclusion within applications, the resource editor gives you the power to create most of the features needed in your programs. A set of prototypes are available which cover the

C/C++ includes a remarkable number of tools – some old, some new.

C++ update

Since C/C++ has been released, Acorn has produced an upgrade to correct a few faults in the package, as well as providing an extra utility named ResCreate to augment the resource editor.

If you'd like to get hold of this upgrade and you're able to access the Internet, you can download it free of charge from Acorn's ftp server, ftp.acorn.co.uk, using anonymous log-in. Acorn Direct is also able to provide the disc if you request the update to C/C++, but there's a nominal handling charge of £5, with cheques made payable to Acorn Direct – you can write to them at 13 Dennington Road, Wellingborough, Northants NN8 2RL.

ResEd allows you to design all manner of windows and menus, and control their behaviour.

major features available in the WIMP system such as windows, quit boxes, slider bars and font selectors. After you've picked the ones suitable for your application, they can be customised and linked to form the bulk of your window-driven software. For instance, it's particularly easy to create multi-level menus with ResEd, and linking them together is just a matter of dragging one menu to a dialogue box of the other.

The Toolbox is undoubtedly extremely powerful resource, and with practice it can simplify the routine procedures of creating the windows interface for your software, leaving you more time to spend on the important parts of the code. However, I would have liked to have seen a better introduction to its use in the

manuals - although a significant amount of space is devoted to the example Hyper application, this program consists of no less than 11 source files and 13 header files. When you're faced with that amount of information, it doesn't make it particularly easy to learn from. Another application has been included, and it's a little less daunting - an implementation of the Acorn calculator using the Toolbox. Although it's not without its bugs, it shows the latent power of the system, since it's possible to completely alter the layout of the calculator using ResEd without changing a line of code.

Conclusions

I must say I'm surprised that Acorn chose to release the package under the banner of a

A page from Hyper, an example application written using Acorn's Toolbox.

Other C++ compilers

Acorn isn't the only company to have produced a C++ compiler, and if you just want to dabble in the language without paying for all the extras, you might want to consider the other products available. Firstly, there's GNU C++, available from a number of sources including the recent Acorn User CD-ROM. It's free of charge, but you'll need a hard disc, 4Mb of memory and a lot of patience to put it together – it's not for the faint hearted. Neither is it suited to writing large WIMP applications, and once you'd got to grips with the language you'd probably want to move on to a compiler which gave you a helping hand in the creation of Desktop programs.

If your machine isn't endowed with stacks of memory or a hard disc, you haven't been forgotten. Beebug's Easy C++ will run on a 2Mb machine from floppy disc. It's simple to use, and although it doesn't contain the likes of Acorn's Toolbox, two WIMP libraries have been provided. Perhaps more importantly, Beebug's product compiles C++ directly without translating into C first, and more of the language has been implemented. Although it's not as suitable for the creation of Desktop applications, it's a good choice if you're interested in learning about C++. Beebug can be contacted on (01727) 840303.

C++ compiler when it has so much more to offer. For instance, I've not had space to discuss the new versions of the C compiler or the assembler, but they've both been updated to cater for the full range of ARM chips - particularly important when you consider where the market's heading. The combination of languages supported allows you to pick the best features from each, so you can utilise the speed of assembler with the flexibility of C and C++.

If you're specifically looking for a C++ compiler, then I'd suggest you think seriously before buying Acorn's version. It's expensive, and to be honest it's not worth it for that alone. However, if you've been using previous incarnations of C and you intend to write complex Desktop applications, the Toolbox is a huge step forward when it comes to program design. If you're prepared to spend some time absorbing the information in the manuals and carefully studying the examples provided, you should be able to produce some impressive applications and slice your development times in the process. Taken as a whole, Acorn's C/C++ is a package of considerable power, and it's definitely worth the outlay if you intend to use it AUseriously.

Product details

Product: Acorn C/C++ (Non-Clan members) Supplier: Acorn dealers Tel: (Acorn Customer Services) (01223) 254254 to find your nearest dealer Price: £249.99 inc VAT. (£50 discount for owners of Desktop C or Desktop Assembler)

(Clan members) Supplier: Acorn Direct Tel: (01933) 279300 Price: £149 + VAT (£99 + VAT for members owning Desktop Cor Desktop Assembler)

Pros: Contains powerful application design tools • Includes improved versions of Acorn's C compiler and Desktop assembler • Discounts for past users and Clan members

Cons: Few examples of C++ included in package

- · Not for the inexperienced
- C++ language not implemented fully

Its finally happened. A company has come up with a simple and inexpensive solution to an age old problem.

Getting access to files stored on a PC has always been a problem for Acorn computer owners. There has always been Floppy Disk transfers, but these are slow and limited to 1.44Mb. There has been several attempts to "Network" the

two computers together but most attempts have been problematic and needed a great deal of extra hardware.

Arcshare is the latest program from KCS which allows any Acorn computer with an Access network card to talk to any PC with a network card & Windows.

Arcshare needs no extra hardware other than cheap network cards. Arcshare is very easy to use through its graphical interface and is, on average 40 times quicker than using a floppy disk, but with no file size limitation. Arcshare can even use CD Rom drives from a different machine.

Copying 51608a.tif to Arch

1317 kbytes

Available Now.

In the Main screen on Arcshare Client, both the Acorn and the PC directories are visible. Files can either be copied, or deleted, even new directories can be created on the Acorn from the PC. Arcshare has the advantage, that it can be run directly from the Windows Filemanager so that file manipulation is simple. Arcshare can run under a Windows for Workgroups network in conjunction with other PC's on the same network. There is no limit as to the amount of Acorns that can be seen from the PC on the Access network.

On the Acorn, the PC directories are designed to look just like any other Acorn directory. In fact, Arcshare makes the PC behave as if it were part of an Access network. Files can be copied from the PC directories to acorn directories in the normal manner. Files can even be copied from one PC to another PC via the Acorn.

It's time to join the PC and the Acorn on the same network. Call KCS now to find out more about Arcshare and networking Acorns to PC's.

Arcshare Client v1.4

- * Allows file transfers between Acorn and PC Computers.
- * No Filesize Limitation.
- Automatic Filetyping when the Acorn receives a file so that the file is ready to be loaded into an application straight away.
- * Automatic File Extensions added when a file is transferred from the Acorn to the PC so that the file can be loaded into a program straight away.
- * Easy to Use Graphic Interface.
- No "Dedicated Server" Computer required.
- Connects directly to Acorn Access Network. Very easy to setup and install.
- Works with Windows 3.1, 3.11, Windows 95 & Windows NT

Arcshare Server v1.4

- * Has ALL the Functions of Arcshare Client v1.4 but with the following additional extras.
- * Allows transfers of files from the Acorn.
- When a Window is open displaying a PC directory, all the files are filetyped even though they are stored on the PC!
- * Files can even be copied from PC to PC from the Acorn.
- * Any Acorn on the Network can access the PC.
- * Makes the PC system look like another Acorn Access system.
- * Files can be loaded into applications directly from the PC.

Available from:

t must be something in the river Esk. Maybe some strange combination of minerals from the water that cascades from the North York Moors down through Eskdale to Whitby has a dramatic effect upon the ability of the local schools to do good DTP. The winner in the Key Stage 3 category of our school competition to design a page in Acorn User came from here - Mark Landers of Eskdale School. So did the winners of the Times Educational Supplement's competition to design a newspaper in a day - a team of over 80 students at Whitby Community College.

The challenge posed by the TES in the Acorn-sponsored competition was to design and produce a national newspaper in a single day: news, features, sport, TV listings, adverts, lost puppy story, the lot. The students at Whitby are no strangers to the competition, having come second last year. So determined were they to achieve that prestigious extra place that they actually produced two magazines: The Apollo printed on the day (15 March) and The Apollo Arts, a 16-page supplement which (in best Blue Peter fashion) they prepared earlier.

Assembling the team

Right from the start *The Apollo* was run on very professional lines. The staff for the magazine wasn't picked in the usual 'whoever was in the library at the time plus my mate Chris 'cos he's got a cool camera' basis. Prospective journalists, ad managers, editors and so on

Top class designers

all had to submit applications, including past experience and ideas, and it was using these that the team was chosen. It is hardly surprising therefore that most of the top jobs were filled by people who had worked on the magazine last year in more humble positions.

In selecting the team, the College staff were careful to draw from all sections of the College community. 'We had students from all years and abilities working on the magazine,' says Stuart Green, one of the teachers who oversaw the project. 'They all played a part, and the whole team worked together very well.'

The editor of *The Apollo* was Charlotte Dominiak. Nicknamed 'the tyrant' (but not within her earshot), she had the final responsibility for seeing that everything ran as smoothly as possible. In this she was greatly assisted by her deputies, Tom Weatherill and Rebecca Cohen, and by Anna Kirby, the sub-editor of *The Apollo Arts*, who also had a

The Times Educational Supplement recently ran an Acorn-sponsored competition for schools to design a newspaper in a day. David Matthewman travelled to Whitby and met the winners.

great influence on the design of *The Apollo*.

Advertising

One notable feature of The Apollo is the amount of advertising it generated. A full 20 per cent of the paper was adverts – a small proportion by Acorn User standards but enough for The Apollo to cover its printing costs. This remarkable achievement was a result of the hard work of the advertising team headed by Peter McCleave, who admits: 'We opened the yellow pages and went through them with a pin. I needed to learn quickly how to deal with companies. In the beginning, the excuse I'd get was "We'll phone you back."

They never did though; I'd have to phone them back and be diplomatic. I didn't want to sound pushy but I did want to get the advert.'

'Many of the adverts in the other entries were made up by the teams involved,' says Charlotte. 'They couldn't believe we'd got all these genuine adverts.'

While most of Peter's advertising was local to Whitby, there were a couple of exceptions, including an eyecatching Rank Xerox ad on the back page of *The Apollo Arts*. Placing ads in the appropriate place in the magazine is all-important, and Peter did a splendid job of arranging his adverts in the right sections.

Stuart Green, deputy head of Mathematics and one of the teachers who oversaw the project.

Some of *The Apollo* team, proudly displaying the plaque they were awarded by the *TES*.

Diana Yeadon, fashion editor on *The Apollo*. The judges singled out her page for praise; it featured four fashion 'makeovers' on members of the College's staff and was both amusing and eye-catching.

He even managed to squeeze a couple onto the front page, something we at *Acorn User* have yet to do. I hope that Beacon Farm and Holman's Bookshop paid Peter well for the privilege.

Good design

It is one of the signs of a welldesigned magazine that you don't stop to notice how welldesigned it is - you are too busy reading it. This is certainly true of both The Apollo and The Apollo Arts, helped no end by the mature and lucid writing style. From the lead story about the tensions between John Major and Bill Clinton (headline 'It's good to talk, John') through to stories about Turkish Moslems, the dubious morality of chequebook journalism and a recipe for spinach and cheddar soufflé, the writing never falters, and the straightforward and consistent layout would put many 'trendy' newsstand magazines to shame.

The Apollo Arts shows some especially deft touches, as befits an arts supplement. Much consideration went into the cover, but eventually a photo of artist William Tillyer's studio ousted a photo of an actor from Heartbeat. 'It was a close thing,' explains Anna Kirby, 'but the studio picture won in the end because of the feeling that the picture was a doorway drawing you into the studio just as the cover draws you into the supple-Matt Young's ment. photography was certainly of a very high standard, as were all the supplement graphics.

Printing the supplement out was achieved by the heroic efforts of Stuart Green and staff editor Rob Myers taking hourly shifts through two complete nights, changing the paper in the printer every two minutes. The master pages

Left to right: Tom Weatherill (deputy editor), Charlotte Dominiak (editor) and Beka Cohen (deputy editor), the editorial staff on *The Apollo* cut the cake which the College had made specially for them, and try not to look too embarrassed.

were produced on a PostScript HP LaserJet 4P which took up to 40 minutes to produce some of the more complicated pages, then printed out in bulk on an A2 photocopier loaned by Rank Xerox. The copier allowed the supplement to contain a limited use of spot colour, which was used most effectively (read sparingly).

Selling out

The Apollo's initial print run of 500 copies was doubled when the first batch sold out to the eager citizens of Whitby, and the (modest) profits will be ploughed back into next year's competition. The Risc PC with an Epson GT-8000 scanner from Irlam and Publisher Plus, which produced The Apollo, has now been joined by a second Risc PC – the College's prize for winning the competition – which will doubtless help greatly next year.

Stories for the magazine

were typed up using *Edit* and *Style* on the College's network of A3020s and A3000s. On 15 March itself there was a constant flow of data round the school, from the 'news gathering room' with TV, Ceefax, radio and telephones, to the various computer rooms, to the Risc PC on which the paper was designed, onto the HP Laserjet for a hard copy and then either off to the photocopier or (more often) back into some stage of the cycle for re-writing.

Whether it is something in the water, or just the simple fact that rigorous selection procedures produced a team of the right people in the right jobs, the students who worked on *The Apollo* should be proud of their efforts. They claim that the experience has put them off journalism for life, but this journalist has got a shrewd suspicion that he's not heard the last from the staff of *The Apollo*.

Rowan Griffin, who did much of the computer work on *The Apollo* (and wrote the lead story) tries out the Risc PC that was the College's prize. In the background is the machine on which *The Apollo* was designed.

Knowing me, David Matthewman, knowing you, James Webster (aha!). In an unexpected turning of the tables, the editor of the College newspaper (left) interviews the deputy editor of *Acorn User*.

the part

Chris Jackson talks to the author of a disc magazine dedicated to that most famous of rock bands, Queen

Club Corner

year or two back, disc magazines were popping up all over the place and it seemed every other week you would hear of a new one. Recently, however, the trend has seemed to die out and disc magazines are now few and far between. Of all the disc magazines remaining, there's only one I know of which is based on a non-computer subject that has been computerised: the Queen Fan Newsletter.

I won't talk much about the QFN, as it hasn't got much to do with computers, but basically it's the newsletter of a club for fans of the Queen rock group, and has around 500 members. As it is one of the larger fan clubs in the country, it has close links with the remaining members of Queen.

David Parr, the founder and editor of the *QFN*, decided he would like to bring the printed newsletters to our computer screens, and being a fan of Acorn computers, he decided to get to work on some code for the front-end of the magazine to work in the Archimedes Deskton

Some months on, with the help of Ian Scott, David Parr has produced a colourful yet easy-to-use multimedia-style front-end which works in the RISC OS Desktop. The text from the newsletter appears in scrollable windows which can be brought up by clicking on icons on a contents page. One good thing about bringing something such as this to the computer is that colour pictures can be used throughout, without putting the printing budget of the magazine up, and I was glad to see plenty of video digitised screen shots from photographs of Queen while in action.

David assured me that

Queen - rocking the Archimedes thanks to David Parr.

although they were very high quality, he hadn't risked infringing copyright laws by taking them off videos. I expected to see a front-end which had been knocked together in a couple of hours, but it is quite the contrary; it is both professional and easy to use, and doesn't suffer from the problems other Acorn multimedia applications do.

The magazine consists of various sections, news, quizzes, classifieds, letters and other items, which make for a very interesting read. Something that would make the magazine better is support for Acorn's interactive help, so new users can navigate through the information as easily as experienced Acorn users. However, there is built-in graphical help, and it seems to

be quite intuitive. The loading screen mentions the possibility of animation, which David tells me he is still working on, so watch out for that in a future issue.

The classified section of the magazine I found particularly interesting as it makes buying and selling Queen memorabilia an enjoyable experience. Items such as CDs, posters and records are all available through the advertisements which are free.

One very good idea of David's is that issues of the disc magazine that are three months old are sent to public domain libraries. This will allow vaguely up-to-date copies of the magazine to be distributed as demo copies, and it will probably entice a lot of people who, wouldn't have

heard of it otherwise, to take a look at the magazine. In conclusion, I think that if you are a fan of Queen you should definitely take a look at this production. It's a perfect demonstration of how paper magazines can be brought into the technological age. The graphics are superb; most of the digitised video is high-resolution and taken from good quality photographs rather than home-made low-quality videos.

David Parr, the person responsible for bringing the Acorn version of QFN to us, can be contacted by phone on (01772) 556117 or by writing to QFN Software, 128 St. Thomas' Rd, Preston, Lancashire PR1 6AY. If you send an SAE and disc he will be able to send you a back issue of the magazine for you to sample. Alternatively, you can download a copy of QFN from my BBS (see my details in the box). Non-UK enquiries should include an IRC (International Reply Coupon) available from Post Offices, as well as a blank floppy. Subscription costs £5 for four issues, which will last a

Contacting me

I would be interested to hear from any Acorn-oriented clubs throughout the world (especially Scotland) to cover in this article. You can get in contact with me by e-mail at

cjackson@digibank.demon.co.uk, via my own BBS 'The Northern Arm BBS' on (01274) 530831 (at up to 14k4) or by post at The Club Page, Acorn User, IDG Media, Media House, Adlington Park, Macclesfield SK10 4NP.

Join the Clan and go to the show all for just £15

Are you enthusiastic about Acorn equipment? Do you want to influence what Acorn is doing? Do you want to keep up with the latest developments? Then this offer is for you!

Clan Acorn gives you the opportunity to be involved in shaping the future direction of Acorn technology. You will receive privileged information about some of the technology the company is considering, and have the chance to feed back your ideas and suggestions directly to Acorn. You will also have an opportunity to evaluate early and beta releases of products.

Acorn World '95 is the annual event that's a must for all Acorn users. Held at Wembley from 27 to 29 October, it's where you can see the latest developments for the Acorn platform in action. This year's theme is the Information Superhighway, the new technology set to revolutionise the way we all communicate.

You will receive a Clan Acorn joining pack which includes an exclusive T-shirt, Risc PC enamel lapel pin, a Clan mouse mat, discs including a demonstration version of the Toolbox, and technology briefing documents about some of the equipment being considered for the Acorn platform plus a free Acorn World '95 ticket - worth £6 - which will get you into the show on the day of your choice. For a further £5 you can have a limited-edition Clan Acorn Risc PC sweatshirt.

To take advantage of this exceptional offer, complete and return the form below. The offer is limited to one ticket per membership.

Acorn's W

Acorn reveals more of its plans for the Acorn World show in October, and there is a Clan Acorn exclusive special offer for Acorn User readers.

here's a definite buzz around Acorn at the moment, as the events planned for the biggest showcase of the year take shape. Months of planning culminate in special offers and exciting new product development - both hardware and software - which the users can see and try out for the first time. With the added dimension of the emerging Information Superhighway and its associated technology - the theme of the show - Acorn World '95 promises to be a mindbending experience for all ages.

Exhibitor bookings, already up on last year, are being boosted by the recent announcement of Acorn's association with Microsoft, as more Internet servers and software suppliers come on board. Microsoft will be making its first appearance at the show - better late than never; other newcomers include Cirrus Software and Softease - and the majority of big names have rebooked. Exhibiting again this year will be Computer Concepts, Beebug, Alsystems, Aleph One, Nelson Multimedia and Academy TV, to name but a few.

A truly multimedia experience

In the multimedia area of the show you'll literally see and hear technology converge. Acorn equipment combines visual imagery, sound and information in a multiplicity of ways - from internal e-mail at its simplest to a new, altogether more sophisticated form of international communication which Acorn is keeping under wraps for the moment.

See how in the future the Acorn user will take

Acorn's busy stand at the show last year.

orld of media

on a more active and creative communications role than ever before, through:

- · an Acorn-equipped creative study of the future, with multimedia workstation, video player, tape deck and digital video editing software, which produces creative imagery on the Internet. Create images and information that people on the other side of the world can pull up on their PC or TV screen.
- · integration of Acorn computer system applications into TV technology.
- · eight-channel digital 'surround sound'.
- · the latest Online Media developments with links to a live recreation of the Cambridge Trial at the show (home shopping, banking, ondemand video and educational programs, plus
- · a domestic CD player playing digital cinema movies.
- · real-time capture of broadcast-quality video and associated editing.
- the latest connectivity between Acorn, PC and other non-Acorn platforms.

Theatre – the experts speak

Always topical, always packed, this forum looks set to be even more popular than last year, so get to a seat in good time. This year's titles include the following unmissable presentations:

Superhighway - the Internet: Acorn's Chris Cox demystifies a subject that we all like to think we already know about.

Superhighway - Online Media: Acorn's associate company explains how its technology is pioneering electronic banking, shopping, videos and education in our living rooms.

Publishing on the Internet: Acorn User's own Mark Moxon and David Matthewman show the future of electronic publishing and introduce the Acorn User WWW pages.

Give your child a head start: Acorn's Alan Bennett points the way to choosing educational software and hardware that's right for your

children, and for the home environment.

Multimedia - myth or magic?: Acorn's Stewart Palmer shows how close to the medium of television and film multimedia can come.

and how you can achieve it. Making Music: Acorn's Jason Laroche proves that with some simple equipment and a little imagination you can create serious music at home.

StrongARM and other limbs: ARM Ltd puts its latest technology in context.

The Acorn World theatre - read all about the exciting presentations planned for this year.

Pocket Book portability: Geoff Lambrechts, IT co-ordinator at Lord Grey School, shows that small is beautiful.

First day; Special day

Underlining the fact that one in every six chidren has some kind of special need, on the first day of this year's show - Friday 27 October - Acorn is hosting a Special Education Conference. Preceded by a series of three forums held at different venues in the UK over the last six months, which included a call for papers, this one-day conference will focus on emerging issues in the important areas of special educational needs.

The conference will include the presentation of six selected papers by speakers who have established themselves as experts in the field of IT and special education. An audience of around 200 teachers, carers and special education co-ordinators is anticipated, and it is open to anyone interested in the area.

The conference fee of £20 includes entrance to Acorn World '95 and covers all conference papers and reports, coffee, lunch and tea. The conference starts at 10.30am and closes at 4.30pm. For more information contact the conference co-ordinator on (01223) 254410.

Coming soon

Watch out for more show news in next month's issue, as Acorn unveils its plans in more detail. We hope to have a sneak preview of the Acorn stand and more about the theatre, special equipment offers, games competitions and prizes you'll find at the show. Don't forget the P&O special offer detailed in last month's Acorn User.

INKJET REFILLS

Inkjet Refills are an economical method of re-charging your existing print cartridge.

Premier Inks produce a complete range of tried & tested refills that are suitable for almost every inkjet printer on the market. The Jet Black refill is much darker than most original cartridges and often dries faster with less overspray, so the output looks clearer than before.

The Refills are packed in convenient ready to use one way syringes and come complete with a safety nozzle and FULL easy to use instructions covering 10 different types of the most popular cartridges. It takes little more than a couple of minutes to refill a print cartridge (whatever the make), and generally saves at least 50% off the cost of a new cartridge.

Using Refills with disposable head print cartridges in no way affects the warranty of your printer as the cartridge is considered a separate item. Also by using the PREMIER range of refile you will not lose out on the quality of print, in fact in most cases using these particular refills can improve the quality of print.

If you are unsure about using Inkjet Refills, call and speak to our staff who will be happy to send you a sample of the print out quality and a set of instructions, so that you can see the results and how easy they are to use, before you decide to buy.

Good Acorn monitor

Regarding your editorial in the May Acorn User, I wonder if Acorn has got this message at last. The AKF60, which is the minimal monitor supplied with the Risc PC, really seems rather good. It competes excellently in sharpness and stability with 'ordinary' multisync monitors I have seen working on PCs down the corridor. I suppose it is too new to know whether it is reliable, though.

I do not think I am alone in liking the monitor. When I was ordering my Risc PC (which was before they were in very abundant supply), I ordered a supposedly superior 14in monitor to replace the AKF60. This was at the stage when Acorn had announced its 'enthusiast' scheme which made this possible. However, Norwich Computer Services recommended that I was wasting my money because their demonstration-model AKF60 seemed at least as good as my proposed alternative.

I suppose one should have a bigger monitor to do justice to the computer, but they are so huge (a fact not mentioned in the reviews) and take up lots of valuable desk space (apart from being rather expensive). I reckon a new pair of glasses is better value.

Philip Draper Via the Internet

AKF18s for free

I read the May 1995 issue with interest, especially the column about the AKF18. I have one, which I bought with my A5000 two years ago, and it has gone wrong four times since. However, Acorn always repaired it under warranty, until I eventually had to pay for a repair.

I claimed the money back from Acorn through a fax, and surprisingly received a letter saying it would replace the monitor. I thought this would take weeks, but within a week of sending the letter, another AKF18, which I am assured does not have the same fault, arrived.

I am praising Acorn for its quick and courteous service.

Hopefully, anyone who is experiencing the same problems as me can write to Acorn and get the same response. Well done Acorn!

K Patel Surrey

Too many adverts

I have read your Acorn User magazine for a few months, and have now stopped. Yes, for a while I put up with the price of £2.95 and

only getting 98 pages.

I worked out that in the October issue there were 98 pages, of which 38 pages were adverts, two pages were subscriptions, another page was for back issues, leaving in total 56 pages worth reading, making it over 20p per page. I'm sorry, but I just can't justify the expenditure. I have now noticed the price has gone up to £3.25.

If there are so many adverts, why the high sale price? My friends who use PCs tell me they get much larger magazines for a fraction of the price.

I can't justify it. Can you? If you can, I would love to hear from you.

Joe Cole London

Of course I can justify it. You've answered your own question when you say that PC magazines are cheaper and bigger – it's because they have far more adverts, so they can afford to keep the price right down. The Acorn market doesn't support that number of advertisers, as the demise of Acorn Computing shows.

We always carry the same amount of editorial coverage – normally 60 pages per issue – so fluctuations in size are down to the changing

There are plenty of DTP packages out there, not just Impression.

marketplace. Summer is a quiet time, and Christmas busier, and the size of the magazine changes to reflect that. However, for your money you are getting the best Acorn coverage this side of the Watford gap, as well as the cover disc, so calculating each issue's worth page by page is a little pointless. If you don't like the contents, then that's different, but the marketplace dictates our price, as with all computer magazines. (MM)

Sleuth reaction

With reference to your review of *Sleuth 2* in the March issue, we feel it is important to point out that some of the points made were inaccurate and/or misleading.

The built-in spelling checker does not 'automatically replace words it thinks are wrong': the spelling checker augments the OCR process. It does this by allowing the program to identify combinations of letters that do not make correct words and suggesting words that might be more suitable. The algorithm can then re-check the data present to see if it fits any of the suggestions well. The process is far more complex than your article suggests.

Sleuth is criticised for not

having a training facility and yet on your tests of a font not known to *Sleuth* you get up to 100 per cent accuracy.

Sheet feeding is a function of the hardware used and would be accessed through TWAIN, so we have no control over this function. Batch processing will be added to the next version of Sleuth.

Finally, our pricing policy has not changed, but our products and the amount of resources required to produce them have. You cannot produce an application of the complexity of *Sleuth* and sell it for the same price as its predecessor. If we did we would not be able to continue to create new applications of the standard of *Sleuth*.

Ian MacDougall Beebug Ltd

Impression ad infinitum

I have read much in the Acorn press recently about 'industry standards' and how PC users should keep an open mind and not be blinkered. One observation I have on this requires the Acorn press – Acorn User included – to look at what they are writing themselves.

I am speaking of the continual references to Computer Concepts' Style and Impression family. Is there to other DTP package around? It seems to be referred to so often and

in such a way that nothing else is considered. There are many Ovation and First Page users out there who, I believe, feel left out. I have seen Style in use and agree that it is jolly good, provided you have something other than a base machine and are not using a standard Acorn monitor. Please give consideration to those at the lower end of the market.

I have bought a DTP application recently: it is neither of the above, it's *Textease* from Softease. I have found it to be very easy to use, and offers a host of features at under £30, which is amazing value for money.

C J Murray Birmingham

It's inevitable that bias will occur when we use one product ourselves so much, and it's a market leader. Still, this month we've got a look at *Ovation Pro*, and next month we'll be looking at *Textease*, so we're not as biased as all that. (MM)

What's cooking

At first I lamented the loss of Acorn Computing. But now I find you have taken on Mike Cook, so all is not lost. I used to buy Acorn Computing because of Mike's excellent articles, among other things.

Alas, I started late in his series for that magazine so have not caught up with the knowledge needed to understand some of his articles. It appears, however, that he is starting afresh with Acorn User, which is good. Just don't forget that a lot of us have the A3000, so don't concentrate solely on the Risc PC!

R H Cumming Cleveland

Mike has no intention of concentrating on newer machines only. In fact, his first article was all about a module which means all his parallel port projects – such as the racing car timer in this issue – will work on all Acorns, whether they have the new bi-directional parallel port or not. (MM)

Douse me in TAOS

After Quentin Pain's letter in June's Acorn User, I felt I should spell out a little more clearly why I think Acorn needs a totally new operating system. Next year will StrongARM chips see running up to ten times faster than the current ARM6. An expansion card carrying six of these would offer a machine with the potential equivalence of 50 Risc PCs in a single box within 18 months, but only if a good multi-processor operating system is available

Trying to beef up old operating systems is expensive and doesn't work. Witness the Windows '95 fiasco. Writing a totally new operating system from scratch would be expensive, take too long and have little or no software available for it

A partnership with other companies must be the only answer. If Acorn really is interested in TAOS, then one possibility would be a TAOS-based version of UNIX with an innovative Acorn frontend. This would be powerful, have everything on your published wish list and, more importantly, would surely be attractive to mainstream computer users.

As to Acorn's actual plans, who knows? I believe Acorn is now at a watershed, with its technology about to offer it the chance to be at the forefront of a computing revolution. To them, and to Quentin Pain, I would say 'look forward!'.

Letters page, but we forgot to
credit him. Sorry Dave, you
know we love you really.

Viewpoint

I love it when we do a reader survey. For one thing it gives an insight into who the typical Acorn user is, if there is such a thing. So here are this year's survey results, translated into English suburbia...

John is our typical Acorn user. I'm calling him a 'him' because 94 per cent of him is male, which is close enough. He doesn't know that Jane next door has an Acorn machine, but that's because he's a bit shy and his stomach gets butterflies whenever she says hello to him. His age is a bit tricky to pin down: he's either between 15 and 25, or between 40 and 50. John thinks his body is 45 and his mind is 20, just like the rest of us.

John's involved in education: he's either a student or involved in Information Technology somewhere along the line. He's tickled pink by his latest purchase, a brand new Risc PC. Although he uses a PC as well at work, he knows which he prefers, and it isn't the PC. He's really not into Macs or other types of computers – they just don't have what it takes.

His main use for his machine is at home for personal things like word processing and playing games. He's dabbled in programming and thinks that if he has the time, he'll try to write some of his own programs, just for fun. But it's just one of those things on his list, like fixing the guttering outside his bedroom window and getting his car serviced.

John's computer is pretty slick – he's got 8Mb of RAM, and he's got RISC OS 3, of course. He can't understand people who still use RISC OS 2; if he wasn't so shy he'd know that even Jane's A3000 has RISC OS 3 and 4Mb of RAM. John's also got a whopping hard disc, with 200Mb of storage.

It gives him a nice, warm feeling to look at the number of add-ons he's got. There's the printer, over there; the fancy monitor; the memory expansion. And when he eventually gets round to it, he'll get even more memory and a CD-ROM system, and probably another hard disc so he can run Windows with that PC card everyone's talking about. If hadn't already bought his Risc PC, he would definitely be buying one as his next computer.

He's also heavily into software: after all, what use is a fast and powerful computer if you don't have any software to run? He's got a word processor, a desktop publishing package, and lots of games. Then there's the spreadsheet, database and graphics package, all of which are great fun. The next purchase? More games, 'cos if there's something we all like in this world it's fun, fun, fun.

John's also keen to purchase a lot of his software on CD-ROM, when he gets his drive. Public Domain CD-ROMs are his favourite, followed closely by resource discs and encyclopaedias. Of course, games on CD-ROM are a good idea, too. All told, John will spend about £700 on hardware and about £150 on software over the next year.

He's also really into Acorn User, so is his best mate Colin who comes round for tea every week. Colin's a bit of a newcomer to the Acorn scene – he's just bought a second-hand A5000, at John's suggestion, and he loves it – but John's been reading Acorn User for well over three years, without missing an issue. Still, seeing John's been into Acorn machines for over six years, it's not surprising really.

His favourite bits of the magazine include the news section, anything to do with problem solving and hints and tips, and he just loves to read about desktop publishing. Overall, the amount of coverage on each subject is about right, but there could be even more problem solving and hints and tips in the magazine. He even likes the cover disc, and thinks it's better than any of the others he's seen. Bless him.

Life's cosy in the world of John, Jane and Colin. Computing is fun because they all own Acorns, not one of those nasty PCs John comes across at work. If only some strange neighbours would move in next door, or the house would turn out to be haunted by a friendly ghost, it could be a mid-evening situation comedy.

Mark Moxon

Uate in the ACORNUSER Awards 1995

It's that time of year when we decide who deserves to be patted on the back for excellence in the Acorn marketplace, and we need your help to vote in the four reader categories in the Acorn User Awards 1995.

To register your vote in the four categories of Best Product, Best Advert, Best Acorn User Article/Series and Best Dealer, fill in this form and post it to: Acorn User Awards 1995, Acorn User, IDG Media, Media House, Adlington Park, Macclesfield SK10 4NP, or e-mail your vote to awards@acornusr.demon.co.uk

Pros: Seamless integration with the Filer • Displays full Mac file name • Full version reads Syquests etc. Cons: Won't read 720K Mac discs

Product: AppleFS Supplier: Oregan Software

Developments Tel: 0121-353 6044 Fax: 0121-353 6472

E-mail: sales@oregan.demon.co.uk

Price: £59.95 (no VAT)

Pros: Reads 720K Mac floppies • Nice configuration options

Cons: Not fully integrated with the

Filer • Won't read Syquests

The Archimedes has been able to read and write PC-format discs practically since its launch, first through applications such as MultiFS and PCDir, then as an integral part of RISC OS 3. Mac discs have been a problem until recently, but now there are two products on the market allowing you to access them. .

800K discs written by older Macs alter the speed at which the disc spins depending upon how far out from the centre of the disc the heads are. There is no way round this, and hence 800K Mac discs cannot be read on Acorn machines at all.

Fortunately, Macs these days have high-density 'SuperDrives' and a 1.44Mb disc format that can, in principle, be read by Acorns. However, Mac filenames can be up to 32 characters long and contain spaces, full stops and several other characters that the RISC OS Filer won't

leaving the filename unchanged. AppleFS. This is a Mac disc \$ File Type Mo ✓ Convert Text ADFS 1.6M ADFS 900K (E) ADFS 900K (D) Acorn to Macintosh MacFS (top) and AppleFS read the ζ 16:56 ecze 🔲 🧶

same Macintosh disc. These two screenshots illustrate a number of the differences mentioned in the

text, including the different way of displaying Mac filenames and AppleFS's icon bar presence. Under scrutiny this month: AppleFS MacFS • Draw_Changer • Calc

support. Also, Mac files are in two parts or 'forks': the data fork and the resource fork. Usually the data fork is the part which is of interest when transferring files, as it contains the data.

Computer Concepts' offering, MacFS, comes in two forms: one to read and write to 3.5in discs only, and one which will access Macintosh SCSI hard discs, Syquests and optical drives. It will only read 1.44Mb floppies, so needs an Acorn with a high density floppy disc drive.

MacFS is very unobtrusive in its operation. If you load it in your boot file, you hardly notice that it's there, except that suddenly you can read discs that previously gave the dreaded 'Disc not understood; has it been formatted?' error. The formatting menu on the icon bar acquires a 'Mac 1.44M' option as well; MacFS is completely integrated with the Filer, and Mac discs are treated as transparently as DOS and RISC OS discs.

Mac filenames are handled very well by MacFS. All 32 characters of the filename are displayed, and if you have LongFiles running on your machine they will be retained when the file is copied to RISC OS. Spaces in a Mac filename become hard spaces (character 160) in RISC OS and a '.' becomes '.' The translation works both ways, so a Mac file can usually be copied to RISC OS and back again

There is a special MacForks file type which, when clicked upon, opens a win-

dow showing both the data and resource forks. Files originating on Archimedes keep their file type and are displayed just as they would be on a RISC OS

disc, and will usually be recognised as having an appropriate type by a Macintosh.

AppleFS

AppleFS places a separate icon on the icon bar, rather in the manner of the RISC OS 2 program MultiFS, which straight away makes it more intrusive than MacFS. It also means that you need to know whether your disc is in Mac format or not before trying it - a real pain unless your disc collection is a lot more ordered than mine is. About the only advantage conferred by this is that AppleFS can display the whole disc name in the title bar of its Filer window.

Its Filer window actually isn't a Filer window. For instance, you can't delete files, rename them, view them as anything other than large icons or run them by double-clicking on them. Just about all you can do is copy them; while this is the most important feature, it's hard to see why the others weren't implemented. Copying single-tasks, and you can't copy over an existing file on a Mac disc.

Filenames are forcibly truncated when the files are copied, and all RISC OS-illegal characters are converted to underscores. Only 16 characters of a filename are displayed in an AppleFS window though full stops, spaces and so on are displayed correctly. Either the resource or the data fork of the file is displayed, and either or both can be copied from the disc.

AppleFS has a much better configuration panel than MacFS to set the mappings between RISC OS and Mac file types (on MacFS you have to edit the !Run file). It also reads, writes and formats 720K Mac floppies, a low-density Mac format with a few advantages over a 720K PC-format disc; it allows Mac-style filenames and can be read on Macs without SuperDrives. IDG's last Mac Plus died some months ago, but doubtless there are some of these beasts still out there.

To sum up, AppleFS is a very capable program, let down by the fact that MacFS does most of what AppleFS does better and with less hassle to the user - the floppy-only version is cheaper, too. A version of AppleFS to read Mac CD-ROMs is promised 'soon'.

David Matthewman

DRAW_Changer

Supplier: DEC_dATA Tel/fax: (01392) 221702

E-mail: info@decdata.zynet.co.uk

Price: £26.85 (no VAT)

Pros: Allows attributes of Draw files to be changed easily in bulk • Export Draw files and thumbnail or full size sprites • Online ClearView help

Cons: Deep sprites can only be produced on the Risc PC • User interface takes a while to get used to

The idea behind DRAW_Changer is simple: you take a Draw file and change the attributes of the elements in it - thicken lines, darken colours, remove fills and so on. All the changes are effected using filters which control which elements in the Draw file are altered

A filter in DRAW_Changer is in two halves: a condition half and an action half. The condition half allows you to choose, say, objects with thin lines or blue fills, or text objects. The action half then tells DRAW_Changer what to do with the objects. Both actions and conditions can be combined so that you can tell DRAW_Changer to delete all red text, or lighten the fill and round the edges of all objects with a 4pt line.

The user interface to filters did take a bit of getting used to. It's perfectly logical,

and the manual explains it well enough, but the design of the interface and the terminology used were unfamiliar enough to cause me a few moments of doubt. However. once I had 'clicked' I found it intuitive and easy to use, though there were a couple of niggles. Line and fill colours have popup menus associated with them, but thin lines, join style and cap style do not, even though it would be useful. One of the most useful features

of DRAW_Changer is the way Draw files can be exported as sprites.

These can either be thumbnails (antialiased to good effect) or full-size sprites. Since the *Draw* file can be magnified to more than fill the screen, sprites larger than the screen size can also be exported in fact this is only limited by disc space. The latest version of DRAW_Changer will also export deep sprites (15- and 24-bit), although only on a Risc PC in the

Using DRAW_Changer to fill in the Elite logo. The filter used fills in transparent objects with a light purple and white-filled objects with a darker purple. Both the start and end results are displayed in a window so that the effects of any changes can be seen.

appropriate mode. 'DRAW_Changer's use is very specific, but for tweaking the output from Draw to get the best results on a printer, or globally changing all thin lines to 0.25pt so that they don't disappear on an imagesetter, it is an excellent product. A demo version can be found on April's CD-ROM – the slightly updated version on sale now offers support for deep sprites and dashed lines.

Geoff Richards

Calc

Supplier: Circular Triangles

Address: 13 Woodhall Terrace, Juniper

Green, Edinburgh EH14 5BR

Price: £25 (no VAT)

Pros: Fast and simple . Supports graphs . Cheap

Cons: Limited functions . No block operations • No interactive help

In the May issue I looked at two low-end spreadsheets - TableCalc and ProSheet and mentioned that I would be looking at a third one called Calc once it had been updated. Well, here it is, complete with nice 3D graphs and an attractive start-up screen.

Looking back at the last two reviews, some of the same criticisms I levelled at the other two spreadsheets should also be applied to Calc. It won't export data except in a native format and as a CSV file, won't load more than one spreadsheet at a time, and won't allow mixed absolute and relative block references in the same operation.

In fact, the normal block operations (cut, copy, paste and clear) aren't available in Calc; the copy and paste function being accessed from a dialogue box. There is no concept of selecting an area of the spreadsheet; when you draw a

graph, you specify an area by typing at a writable icon in the graph dialogue box.

Enough of the drawbacks - Calc has in its favour a simple design, allowing people who just need a basic spreadsheet with uncomplicated graphing facilities to use it easily. It is fast, and only occu-400K pies memory, an important consideration for those with lowerend machines. It has

a limited range of functions - the same sort of range as you'd find on a normal pocket calculator - which should satisfy the low-end users at which Calc is aimed. Its lack of ability to import Draw files is, in a way, a good thing as it allows Calc to concentrate on being a spreadsheet rather than being a substitute page design package, though it would be nice if Calc sheets could be exported as Draw files for inclusion in DTP packages.

Calc offers four graph types: bar, scat-

Calc offers basic spreadsheet facilities and graphs at an affordable price.

ter, pie and ribbon. A few more options to control the look of the graphs would have been welcome, but the graphs produced by default are attractive, and can be saved as Draw files.

At £25, Calc does the job you'd expect without trying to be over-ambitious. Certainly, many people will need the extra power of Resultz, Eureka or Schema, but for those who don't, Calc offers a cheap, serviceable solution.

78 Brighton Road, Worthing, West Sussex. BN11 2EN. Telephone 01903 213361 Fax 213901 email: cjemicro@pavilion.co.uk (n.b. we log on about twice a week)

Before I start, thanks to everyone who's written in over the past couple of months. I've been receiving lots of information from programming teams wanting to tell you what they're up to, so you'll be seeing the results of that over the next few months.

Back to the present, and you'll be pleased to know that Tom Cooper, author of such diverse games as Hamsters and Wavelength, is working on a new title currently being developed under the foreboding name of Darkwood. Coding is still very much in progress, but from what I've seen it promises to be another landmark game for the Acorn. I can't give too much away at the moment, but if you can imagine putting Pandora's Box and Arcturus into a blender and adding a generous squeeze of Tom's deliciously quirky humour, you'd be on the right lines.

Magnetic Image released the Falcon Analogue, its joystick interface for 15-pin analogue sticks and yokes, at the Harrogate Spring Show, and I've been taking it for a test flight.

Why bother with an analogue device when you've got a perfectly usable joypad? Well, whereas a digital joystick broadcasts definite directions to the computer, an analogue stick sends a fractional movement value which allows more realistic control in certain games. The hardware consists of a small box that plugs into your parallel port in much the same way as a dongle. You'll have to buy a joystick separately if you don't already own one - the stick I was using was a Quickshot Super Warrior, complete with microswitched fire buttons and a separate throttle control. The interface is reported to work with most joystick types, allowing you to pick your own personal favourite.

The setup options can seem a little bewildering at first, and this is probably the weakest part of the product. However, once you've played about with the software for a while it's fairly easy to tune the interface's operation. Be prepared to fiddle with the calibration to get it just right. Setting up a joystick requires instructing the interface about the stick's ranges of movement - after this has been completed, the fire buttons can

programmed. You can have up to four 'real' buttons, but if that's not enough you can emulate up to four more by pressing the fire buttons in sequence.

Analogue joysticks aren't effective in all cases, and the Falcon is only at its best for playing games controlled by the mouse; however, it comes into its own in the racing games and flight simulators of this world -Star Fighter 3000 is certainly a prime candidate, as is Elite on this month's cover disc. The Falcon interface fills the analogue gap in the Acorn market, and allows dedicated players to get that little bit more out of their favourites. You can contact Magnetic Image for more information on (01376) 500590.

The making of

I've been talking to Graham Tootell, alias Nikki, about the production of Detritus, the new graphics adventure by Myndgaemz.

What's the background to the game?

We decided to base Detritus on the Isle of Wight, which became the little island of Quarea. The idea of a nuclear holocaust dealt with the rest of the world,

and neatly explained why these people had gone back to living in the middle ages. We chose to have a girl as the hero as opposed to so many games where the huge muscle-bound bloke goes off to rescue the poor, helpless little girl - this time, it's the girl who sets out to rescue her weak little boyfriend, kidnapped by a Daemon by the name of Arrut Loopaz.

We chose the Old English spelling of daemon to avoid the connotations of black magic and Satanism associated with demons. A daemon in the Old English sense

merely meant an unexplained entity, something that doesn't appear to fit in with this world, so had 'magical' powers.

How did you manage to capture the atmosphere of the

One of the Myndgaemz team had managed to get permission to shoot the footage at Little Woodham, the Gosport 17th century village, for which we are eternally grateful. It was the perfect scenery for what we wanted and because he was part of the Living History society we could also get authentic costumes and artefacts.

Were you able to use the photographs directly, or did you have to do some editing?

Very few of the scenes are actually completely 'real' most have been made by cutting and pasting bits of other pictures together. My favourite has to be the temple to Arrut Loopaz, which consists of a section of car park blended with part of a well-known shop, with all identifying features removed. People always tell me that I forgot to edit out the words 'Electrical Store' from the top of the shop this amuses me as I deliberately put them there myself!

Have you got anything planned for the future?

As far as future projects go, there was talk of the Blue Moon project, based on a futuristic spaceship that's been taken over by terrorists - it might well be on CD-ROM as it could feature full-screen video animation and speech. The Myndgaemz Video Compression System can now compress pictures even further than our previous method at better quality. We're not sure whether Blue Moon will go ahead yet; we might concentrate on selling MCVS separately, so we'll have to see how things go.

If you'd like some more information about Detritus, you can contact Byte Back Computing at 0115-955 4501.

Setting up the falcon analogue joystick is a bit fiddly, but it can really improve the playability of a game.

Star Fighter 3D0

Last month, I mentioned that Krisalis was responsible for an imminent conversion of Fednet's superb three-dimensional blastfest, Star Fighter 3000, for the 3DO multiplayer. Since then, I've been able to dredge up some more information, so if you've ever wondered how Star Fighter could be improved, here are a few of the details.

Firstly, all the graphics for the game are now displayed in gorgeous 16-bit colour, and everything's textured, light sourced and depth cued to make the landscapes seem that bit more 'solid'. The expanses of water, which used to remain unnervingly still, now undulate - and the ships and submarines rock with the waves, making them even harder to hit. In terms of ground targets, you've now got tanks and lorries to contend with, and they're armed as well as mobile.

One point of criticism levelled at the original game was that an internal view wasn't available – this has changed with the 3DO version and now you can play Star Fighter as if it were a flight simulator. The game runs at about 15 frames per second, which isn't bad considering the amount of extra detail squeezed into the code. I've been lucky enough to lay my hands on some screenshots from the game,

so take a look and prepare to be amazed.

Hang on a moment, though why am I covering a 3DO game in an Acorn-based column? I suppose it's because I've followed Star Fighter from its initial demo versions, and I'm proud to see it make the quantum leap from the Acorn platform to the big, bad world of the consoles - I'll be particularly interested to see how it's received. Many thanks to Rob Wyatt of Krisalis for furnishing me with the information, and of course Andrew Hutchings and Tim Parry for writing the game in the first place!

And finally

Well, that's all I've got time for, but next month I'll be taking a look at methods of improving your chances as mayor in Sim City 2000, as well as divulging a few hints for the strategy game Dune II. If you've got any playing strategies or tips that you want to share, or you just want to drop us a line, here's how to contact us. You can write to us at: Game Show, Acorn User, IDG Media, Media House, Adlington Park, Macclesfield SK10 4NP.

If you're plugged into the Internet, you can also reach me, Steve Mumford, by e-mail at:

HAL@acornusr.demon.co.uk. Steve Mumford

Light-sourced 32-bit graphics make Starfighter 3000 on the 3DO far more realistic than its Archimedes counterpart.

Star Fighter codes

I've had an amazing response from the *Star Fighter* fans out there, so thanks are due to Phil Norman, Rob Wyatt, Daniel Shimmin, Malcolm Leadbetter, Damian Le Gresley and anyone else who's contributed. Phil has even given each level an enjoyment rating, so here are a few of his favourites – the full listings are on the cover disc.

S o, you've taken the plunge and bought yourself a brand new shiny CD-ROM drive or, like my school, you were successful in your bid for an NCET CD-ROM Initiative system. Now what? The early years children have read the Naughty Stories and the older ones are happy using Hutchinson's Encyclopaedia for a spot of research. It's not too long before you find there is a relative scarcity of CD-ROM titles for Acorn machines. What do you do?

Well, you could wait a while, because there are certainly more titles coming along and they're even appearing on magazine covers. Better than waiting, though, would be to take a little time out to investigate Photo CD. It's inexpensive, it's easily linked to most, if not all, of the National Curriculum subjects and, best of all, the material stored on it can directly reflect pupils' own interests and experiences.

Smile please, you're on a

Photo CD and IT

My experience with Photo CD started last summer after our Year 5 pupils made their annual residential visit to Whitby and our Year 6 pupils went to France. We did the usual thing and made a photographic record of their experiences but I wanted them to do something different with it and, if possible, integrate it into their IT. As it happened, we had just

received the NCET system and I wanted to do what I could to explore it with the children before they left us for high school. What better way to get them involved than by using it to display manipulated images of them on their journeys.

Transferring images to Photo CD is easy to arrange and any number of high street chemists, including the large national chains and smaller independents, will do it. My local independent chemist will take exposed film and arrange for it to be transferred for just over £12 for a 36 exposure film plus £4.99 for the CD. If you don't want the whole film to be transferred then single images from negative strips cost in the region of 40p each, more expensive but more selective. The process takes five days for normal colour film and twice that for slide film or black and white.

Having collected the CD it is a quick and easy job to see the results by using Acorn's Photoview which seems to come bundled with most CD-ROM drives. Clicking on the application on the icon bar causes it to read the CD and display the photographs as a series of small thumbnail images. Using an 800x600 screen on my Risc PC, for example, it will display the first 12 images with the rest accessible by dragging the window's slider.

For a proper screen-sized look at an image it then takes just a few seconds for Photoview to process the data on the CD and come up with a stunning full-screen picture. Kathryn and Susan, my fairly blasé daughters, are used to me

yelling 'Have a look at this!' when I'm playing with a new toy, but both were more than a little impressed when they saw the quality. In fact they were so impressed they actually wanted to search the CD to check out the photographs of the cat (who also seemed to be pleased with the results).

Creating presentations

Using the computer simply to display the images was a start, but actually manipulating them and using them in some kind of multimedia presentation was what I wanted to do at school with the children. After a little experimentation, I decided to work in two separate ways.

The first was to produce a slide show of selected and suitably captioned images. Pupils used the contact type prints which came with the CD to choose a number of images which would help them tell the story of part of the visit. This was done by loading them into Photoview and then transferring them into Revelation where the text tool was used to add a caption in a colour and font of the children's choice. Once completed, the images were saved into a separate directory using numbers for names to ensure that the order in which they were shown could easily be controlled. Dragging the directory onto Roger Wilson's Picture application then created the rolling slide show.

The second presentation we created used Genesis Professional from Oak Solutions. Although more difficult to set up, Genesis offered the opportunity to include

Genesis Professional was used to create a multimedia presentation. Here, using Photo CD images, pupils recorded a visit to Whitby, and worked on a presentation based on the visit.

Frank Jukes takes a look at how Photo CD can help your school's underworked CD-ROM drive be better employed.

plastic disc!

more text with our images and sound as well.

Having set up a master page and discussed with the children which areas they thought they should report on, the children produced their text and entered it directly into Genesis. Images from the Photo CD were then selected and used to illustrate the text by dropping them into their own individual pages or into specially created frames on text pages. Just to extend the work a little more we then used Black Box from Focus IT to sample the children reading page titles which were then dropped into frames on a contents page.

Overall, the presentations worked extremely well and the children (and their teacher) were delighted with what they had produced. The skills they had learnt and practised were not inconsiderable and it is noticeable that they are now more confident and adventurous when using the computer to display and report on their work.

Problems

There were, quite naturally, problems along the way though, and the first of these concerned Photoview which, as each thumbnail image is displayed, gradually eats up more memory. With up to 100 images available on a CD this is not much of a problem if you want to use, say, the fifteenth, but it's not so good if you want to use the 95th. The school's 4Mb A5000 coped well, began to struggle, and then eventually failed to convert the thumbnails as did my 5Mb Risc PC. After quitting all unnecessary applications,

reducing the font cache and trying all else I knew would free up memory, I still could not display the higher numbered images. A different approach was called for which, after a lot of head scratching, turned out to be straightforward. Photoview was used to display the thumbnails to choose the image and then the relevant file was dragged straight from the Photo CD into ChangeFSI to allow it to do the conversion. Later on we bypassed Photoview and chose the images directly from the contact sheets before dropping them onto ChangeFSI.

Other problems concerned the slide show and *Genesis* specifically. In the first we found that portrait-oriented images would not display correctly as they were 'too tall' for the screen. Although we felt that some were potentially very useful, we decided it was important to produce a presentation that looked right, so we

would not use them unless the part of the picture we wanted was the part displayed and the image did not look unbalanced; fairly obvious I suppose really, but it caused some useful discussion at the time.

The main problems with *Genesis* concerned the need to drop correctlysized images into the page and the overall size of the completed presentation. Dropping in

images directly from the Photo CD did not work as they came across full size and swamped the page. Re-sizing them in Paint solved this but added another task into the process. This problem was also linked to the problem with the overall size of the presentation, in that the images were large and took up a lot of disc space. Put alongside the sound samples and the children's text we found we had problems using floppy discs to transfer the work from one machine to another, and eventually had to compromise on what we wanted to

The problems, though, were not overwhelming and served to concentrate our minds. The most important thing was that we had explored another aspect of IT and found that it offered a lot in terms of increasing and extending skills, and in allowing us to present reports in a more exciting and interesting way.

Future projects

For the future, I think Photo CD may well offer staff opportunities for record keeping by using the multi-session capabilities of the medium, which allows many different sets of pictures to be recorded on one disc at different times. We already record pupil's achievements in subjects like design technology by taking photographs. If these were to be transferred to Photo CD as and when they were taken, the problems of storage would be greatly reduced, they would be more secure and less easily damaged, and it would also be possible to create a school portfolio to show how work through the school might progress.

In the meantime, we will certainly be exploring and exploiting Photo CD again to enhance and extend work following our 1995 visits, and then most likely to create a presentation based on 'Our School'.

tation. Dropping in Photo CD offers an excellent method of recording school visits.

TableMate "Possibly an essential purchase" - TableMate 2 Review, Archive May 95

Great news! There's now TableMate 3!

- A Buttonbar & Interactive help support
- · Simple spreadsheet facilities
- Vertical joining of cells, vertical tabs
- Extended import & export ... and much more!

Available NOW! Prices held while stocks last!

Full price £32-50 inc p&p - upg. from Impression Style £17-50 Secondary Site £100 (£55 as Imp. upg.), Primary £65 (£35 upg.)

Phone /SAE for details!

RISC OS 3.x System Defense Kit

"They rename the hard disc ... scramble the configuration... turn off the auto-boot... reset the system clock... do factory resets..." The solution is SpoilSport. £30.00 inc.

Multi-user File Security System

"Frozen" directories or application folders are made unchangeable except by the IronMask superuser. "Shielded" files are made completely inaccessible except to their owners. User authentication. Failsafe encryption. The software solution for RISC OS security in school or office. £55.00 inc.

IronMask 2.1 + SpoilSport £65.00. 10% OFF all prices for prompt payment (14 days).

Prices quoted for 1 computer. British Isles postage included. Overseas add £3.00. To for educational and site prices, further information or factsheets. Allow 14 days delivery.

Postcards from Harrogate

or 51 weeks of the year, my only contact with people from the Acorn world is either on the telephone, by e-mail or letter. Some people I do see regularly, but most are just voices at the end of the phone. The *Acorn User* exhibition is a chance to put some faces to names and to thank all those who have helped me during the year, both as writer and teacher.

Apart from all the companies who made the show successful, two schools had some of their students there working on Acorn Computers and producing some quite excellent work.

On Saturday, the pupils from St Peter's C of E Primary School in Harrogate showed us what they could do. Using *Phases* and *Splosh* they produced some flyers advertising what's on in Harrogate, including snippets of information about the *Acorn User* Show. As you can see by the quality of the work, they certainly knew what they were doing. Dominic Diamond was the celebrity for Saturday and he was clearly very impressed by the work.

Equally impressed was Violet Berlin who was Sunday's celebrity. She spent a considerable amount of time with the pupils of Castleton Primary School in Leeds. They were using *Impression Style*, *Paint* and *Draw* and produced some superb two-fold pamphlets containing text and graphics relating to VE Day, with some additional pieces on the *Acorn User* Show. I was continually having to remind myself that these were primary school children and not a group of teenagers just about to take their GCSEs.

Our very sincere thanks to all the pupils who

The pupils from Castleton school produced a superb two-fold pamphlet using *Style*.

Geoff Preston recalls some of the highlights of the Acorn User show. came along to show us what they could do, and a special vote of thanks to the teachers who gave up a great deal of their time. The two schools will each receive a one year's subscription to Acorn User by way of thanks.

Sherston also had groups of children using its software, in particular some of the Sherston talking books. It never ceases to amaze me how young children will walk up to a computer and just start using it. Adults usually stand back and wait for a lead from their children.

Sherston's bustling stand deservedly won one of the show awards.

An editorial conference among the pupils from Castleton Primary School in Leeds.

Setting the

Bill Lamin, director of Information Technology at Pool School and Community College, looks at Acorns in the classroom and suggests some minimum specifications.

y sister is a very experienced primary school teacher. Recently we talked a little about work, (I'm a teacher, but in a secondary school) and it soon became clear that she was quite disappointed with her classroom Archimedes computer. It was obvious that her machine, a basic A3000, was not at all up to the demands of a busy classroom.

I suspect there must be hundreds of similar classrooms across the country with relatively modern computers that are not being used effectively. Within every one of these, a teacher will be feeling very insecure and inadequate. Of course, the problem lies, not with the teacher, but with the hardware standard. It's not enough just to buy a modern computer. Non-specialist teachers need a properly equipped and prepared machine or they are certain to fail to realise its potential. Without doubt, the great value of the new technology is, in many schools, being spoiled for a ha'p'eth of tar.

MESH

Some years ago, one of the Spence-Jones of S J Research fame produced a document entitled *MESH - Minimum Education Standard Hardware*, outlining the minimum configuration for a BBC computer to be effective in the classroom. At the time we thought that it was a great document - especially as most of our computers met the standard - and promptly used it as a lever to get the money to upgrade the rest.

Now it appears that there is justification for an updated version of MESH. Many classroom teachers are making desperate efforts to make effective use of totally inadequate machines. Even one of our major teacher training establishments in the south west is expecting its embryo teachers to sample woefully basic Acorn machines. I can define a current minimum standard for Acorn machines, a standard that should apply throughout the four key stages. I am sure that someone else could produce a similar specification for other platforms - PCs and Apples. If we are expecting non-specialist teachers to use computers in their classrooms, then we

must ensure that they have the equipment that they need.

Beware of floppies

Floppy discs and their drives are a crucial weak point in any system – especially in a classroom environment. The discs are not child-proof. The disc drives contain moving parts and there are different standards of disc and disc drive. Discs are not interchangeable between standards. Once damaged, a disc is worse than useless. As it 'looks' OK, a problem probably won't be discovered until it's too late and a lesson is ruined. The last thing a teacher with 30+ kids needs is a stubbornly dead disc – the whole package is a potential disaster.

Every machine should be fitted with a hard drive or, better still, networked. Then, all these irrelevancies can be forgotten. The software is instantly, simply and - above all - reliably available to pupils. Networking is by far the better solution, but this may present problems for a small primary school. As an alternative, a hard drive could be partitioned, with the applications protected from pupil tampering. On a relatively small (80Mb) drive, a primary school should be able to store all its applications and still have a few Mb left for pupils' work. It may (just) be acceptable for pupils to use floppies for saving their own work but, if so, it shouldn't come as a great surprise to find any spare hard disc space filled with Lemmings, Pacman or even worse. In my school, everything is networked and the floppy disc drives are disconnected.

Memory and operating system

About two years ago, Acorn introduced a new operating system, imaginatively called RISC OS 3. It replaced (you've probably guessed) RISC OS 2. The new system offered many advantages, so new software started to be written around it. Sadly, the newer software often doesn't work on machines fitted with RISC OS 2. Unless you want to be stuck with the ancient, obsolete software, all computers must be upgraded to RISC OS 3.

The working memory of a computer is

standard

termed RAM and is measured in megabytes (Mb). Older machines left the factory fitted with 1Mb of RAM which was quite adequate for most programs. Now, new machines are sold with 2Mb of RAM and the software writers are producing programs that use this extra capacity. Indeed, for many of the new applications, 2Mb is proving inadequate, and even mildly serious users are upgrading their machines to 4Mb. (*Impression*, *Fireworkz* and the like will struggle with only 2Mb.)

2Mb is the very minimum, but be prepared for a revision of this standard to 4Mb in the very near future.

Don't settle for second best

That's it then: network or hard disc, RISC OS 3 and 2Mb of RAM. If you have better, smile. If you're expected to cope with less, then shout and make a fuss. Your school is wasting valuable resources you as a teacher, as well as your computer. If nothing happens, switch off your computer and wait for OFSTED and explain to them why it isn't being used. A computer specialist may cope, but many IT co-ordinators fail to realise that the result of giving inadequate hardware to a non-specialist classroom teacher is likely to be considerable frustration, insecurity and a significant waste of valuable time. The computer will be used only for 'safe' non-demanding applications and will fail to repay the considerable financial

For £225 the A3000 can be brought up to a reasonable specification that will run most modern software – could you say the same of a six-year-old Mac or PC?

investment. Worse still, the poor teacher, already under pressure from other directions, will reject this potentially valuable resource.

You must move to this minimum standard. Once your computer is there, your IT specialist or advisory team can easily load in software and then you just point the kids at it. Everything should be easily accessible and, more importantly, work every time.

Take this article to your Head and/or Governors – try the Parent Teachers Association, but don't settle for less.

What will it cost to upgrade?

Technology Matrix in Manchester has agreed to some upgrade deals for *Acorn User* readers from educational establishments; our thanks to it. To claim this special discount on the following products, cut out the token at the top of the page, fix it to an official order form from your school and send it to: Technology Matrix, 89A Stockport Road, Denton, Manchester M34 6DD (all prices exclude VAT).

Case study 1: a basic A3000 with 1Mb RAM, RISC OS 2 and no hard drive. This is a typical classroom failure machine. But for £225 it could be made into a more usable machine.

1. 80 Mb Hard Disc £155
2. RISC OS 3 Upgrade(No manuals*) £ 37
3. 1 to 2Mb RAM upgrade £ 58
Less £25 discount from Technology Matrix £225 including discount

*The last thing a classroom teacher needs is yet another computer operating system manual. Anyway, they are free with every new computer, so your school probably has several sets still shrink wrapped!

Upgrading the A3000 sounds expensive, but there is little real choice if

the machine is to have any value at all. Once it is upgraded, it can be used effectively in the classroom with a wide range of the latest exciting classroom software.

Case Study 2: an A3020 floppy disc system – a 'Tesco tokens' gift. This will already have RISC OS 3 and 2Mb of RAM.

1. 80 Mb hard Disc £109 less £20 discount from Technology Matrix £89

A basic network kit is relatively cheap. Once one machine is set up as a server, about £140 per machine will allow all machines to share resources through Acorn Access. There is an additional cost, but the extra benefits from networking are also significant.

You need a confident technical type to fit the bits: nothing too sophisticated, as none of the fittings are difficult and the instructions are very clear. Technology Matrix is happy to provide a free 'real time' telephone support for any DIY upgrades.

ince its launch late last year, Clicker has very quickly established itself as a major software product. For the benefit of those who haven't used it, Clicker (at its simplest level) is rather like Chars which is found in the Apps folder on the icon bar. Chars displays a window containing the full character set and clicking on a character will print it at the current carat position.

Clicker takes this concept further by enabling the user to transfer whole words or even sentences in the same way. Even better is the fact that grids can be very easily constructed for a whole variety of uses. On the education disc distributed to Acorn User subscribers last year was a Clicker file which displays a number of chemical names. When you click on the name in one of the cells, it prints the chemical formula for that chemical at the carat, thus demonstrating that Clicker can be programmed to 'translate.'

Not surprisingly, the program is used in many diverse ways - probably more than the author originally envisaged. One way the author had intended Clicker to be used is by students with special needs, including those with physical difficulty. Because Clicker can output commands to the computer, it can be used for loading programs and files, all from the click of a mouse button. However, Crick Computing has also produced a version called Switch Clicker which enables the whole system to be controlled by a single on/off switch. This could be a foot operated switch, a tilt switch or any two-state device.

The latest version of this program, called Clicker Plus (with the switch version called Switch Clicker Plus) does everything the previous version does, but a lot more besides. Clicker Plus is a well

Clickety click

Geoff Preston reviews Clicker Plus from Crick Computing, and suggests some practical uses for the program.

presented package which immediately exudes quality. It comes in a sturdy grey A5 folder, with a well written spiral bound manual. The program is on a single disc, and there are two additional discs containing examples of grids and multimedia presentations. My only criticism is that some of the pictures in the manual have not reproduced well. If a book is to be reproduced by so-called 'photo-typesetting' (effectively photocopying onto a printer's plate), it's better to avoid 3D

Clicker has evolved into a sort of multimedia authoring/display system, while still retaining its simplicity both for the user, and for the person creating the Clicker Plus files (or grids as they are more correctly described). Grids can beconstructed to include graphics and sound samples as well as computer-generated speech, which is about the best I've heard, although still a little robotic.

Click actions include sending text to the current caret and loading another Clicker file. This facility enables substantial multimedia presentations to be created. Talking books can also be created very easily, with a little time spent drawing

some pictures and recording some speech. One interesting feature is *Clicker's* ability to load one grid from another. The trouble is, as all linked grids are usually found in the same directory, the user is presented with a number of grids with little indication (other than careful file naming) of which should be accessed first. If creating such a presentation with Clicker Plus, it is better to place all the grids in an application directory (prefixed) and place !Run and !Sprites files inside, together with all the grids and sound samples associated with the presentation. !Run should be set to load the first grid and !Sprites should contain a suitable application icon. An example of the structure is included on the cover disc.

At £55 for a five-machine licence, I can't think of a good reason why this isn't in every school and used on a regular basis to help support some of our students who have learning difficulties. But apart from special needs, Modern Languages will find many uses for it, including grids for accessing non-keyboard characters used in German (such as B Ö ä) and French (such as È é á).

As with previous examples of quality software I review, readers may send me their Clicker Plus grids and I will compile a disc of all of them and distribute them to those who contributed (and to Crick Computing for its reference). Please mark discs Clicker files.

The 'traditional' grid. Clicking on a blue box opens up a new linked grid. Clicking on a beige box prints the word at the carat, clicking on a grey box carries out the action.

Product details

Product: Clicker Plus Supplier: Crick Computing Tel: (01604) 713686

Price: £55 for a five-user licence. An upgrade from Clicker is £20.

Pros: Very versatile • Easy to use • Ideal for special needs

Cons: Speech software is a little robotic . Some pictures in the manual have not reproduced well

The Really Good Software Company 39 Carisbrooke Road,

Harpenden, Herts AL5 5QS

Notice Board

- Create unattended, multiple
- message 'poster' presentations
- Powerful, yet easy to use
- Ideal for schools, waiting rooms,
- reception areas, exhibitions, etc.

£35.00

VideoTrak

- Get your video film collection under control with all-new VideoTrak
- Set up a fully cross-referenced database that gives instant access by film title, actor, director, etc.

£15

Good Software

MultiLink

- Transfer data effortlessly between
- BBC 8-bit and RISC OS 32-bit
- computers including the RISC PC
- Intuitive click and drag operation
 - £24.95 (with serial cable £29.95)

Softcrete

- Beat the potential software thief and
- stop unauthorised use of programs
- Password protect your programs
- Restrict use to one machine or a
 - number of computers

Program security for £24.95

Notes

- A sticky note pad for your desktop
- Attach notes to discs, documents
- and directories
 - Endlessly useful yet only £9.95!
 - Payment by cheque or PO payable to The Really Good Software Company
 - Official orders welcomed.

Questions

Using modes consistently between different machines. memory problems on an A310, PD in Australia and connecting a CD-ROM drive. answers

I have recently bought a Risc PC, and have been impressed with graphics capabilities (my old A3010 hasn't got a chance any

After experimenting with the new features, and completing Simon the Sorcerer, I eventually got around to trying out a little programming on my new machine.

I managed to work out how to use the new mode selecting system, aided by my PRMs, but when I ran any programs that I had written for my A3010 which mostly use mode 13 the display was squashed vertically. Is this because of the computer or the monitor?

How can I correct the programs so that they display fullscreen graphics on both my A3010 and my Risc PC (which has 2Mb VRAM and an AKF60 monitor)? If possible, I would like a method which will work correctly under RISC OS 2 and on any machine with a graphics enhancer, so that my programs can be used as widely as possible.

Also, how do I qualify my

programs for distribution as PD or Shareware products, and what are the terms and conditions involved?

> **Russell Palmer** Stourbridge

Mode 13 and many of the older modes do not display full-screen on the Risc PC because their refresh rates and line resolutions are too low for the monitor to display correctly. Instead, the monitor 'fakes' mode 13 by displaying a faster mode and slotting the mode 13 in the middle portion otherwise blank screen.

While it is of course possible to alter the monitor controls so that a reasonably full picture is displayed, this is a very unsatisfactory solution.

The excellent utility Game On! from The ARM Club (tel: 0171-624 9918) gets round this problem by designing a new set of 100Hz modes onto which the old 50Hz modes are mapped. This by itself gives full-screen modes that run, well, quickly - Elite at

100Hz is frightening - but Game On! also gives the option to trap every second VSync, so that games which rely on the screen refresh rate for their timing run at the correct speed.

Several of the writers in the *INFO section of the magazine effectively use this method of ensuring that their programs run on the Risc PC, that is, they use mode 13 regardless. While this is fine for the sort of program featured in *INFO, it would hardly be adequate for commercial software written after the launch of the Risc PC to use this approach.

Several games - Dune II for instance - give an option to choose the screen mode from an icon bar menu. This can, of course, also be useful for raising the amount of detail available on faster machines. This can also be done automatically from the program, as it detects what operating system running on.

This approach needs more work when programming, as

different routines will probably be needed by different screen resolutions and sizes. What is ideally needed is a 'standard' mode which will work with most types of monitor. Mode 28 fits the bill quite well, working on multisync, VGA and SVGA monitors, but it is also heavily memoryand processorintensive.

To remedy this, Acorn developed modes 48 and 49, which run on the same types of monitor as mode 28, providing 16 and 256 colours respectively. The modes run at 60Hz with 320x480 pixels, and are similar enough to mode 13 that programs can easily be written to run in mode 13 on older (type 0) monitors and in mode 49 on newer ones. Mode 49 is a full-screen mode on the Risc

The slight drawback with this approach is that modes 48 and 49 are not standard on any version of RISC OS before RISC OS 3.5. They are available as a separate module from Acorn, which therefore must be distributed with your program if it uses them. Contact Acorn - tel (01223) 254254 - about conditions for distributing the module if you are interested. It was on the CD-ROM in the archive ACORN.FTP.DOCS. APPNOTES.200-215.202C needing Spark to decode it so there shouldn't be many problems.

Naturally, if you are writing a program to run in the Desktop, it should not assume that it is running in

Dune II allows the user to select the mode that it runs in, depending upon the monitor available.

any particular mode. It should work in 16 and 256 colour modes, as well as the higher number of colour modes on the Risc PC - the ColourTrans module provides a host of SWIs to help with this, as documented in the PRMs.

Ideally, the program should also work in the high resolution mono mode 23 (not supported on the Risc PC) which is only for use with hi-res mono monitors. This can be a little hard to test, unfortunately, as most monitors cannot actually display mode 23.

As for 'qualifying' programs as PD or Shareware, this is something that you need to do for yourself. The basic situation is that any program you write is your own property and may not be copied or distributed by anyone else without your permission. Permission can be (and often is) given explicitly in the !Help file with the program, or in a separate Licence file.

There is no 'set wording' for this. The rule is to keep it as clear as possible. If the file is freely distributable, but not by someone making a profit, then say so. If you want anyone using the program for over a week to send you £10 registration, then say that as well. The clearer you make your instructions, the more of a leg you will have to stand on if someone claims to have misunderstood.

I have an A310, which has been upgraded to 4Mb of memory and RISC OS 3. It also contains a FaxPack and a high-density disc drive interface, as well as a SCSI hard disc.

This has served me well for many years, and I find it entirely satisfactory for writing letters and doing a bit of home accounting. I even design letterheads in Paint.

Recently though, I have been having problems. I have noticed that occasionally a picture I am drawing in Paint will become corrupted, with odd pixels changing colour for no reason. Worse than that, programs will sometimes crash with an address exception, or an unknown SWI. These are programs which I have never had problems with before.

I haven't added anything new to my system for a while, so what is causing these errors; is it a hardware problem?

Harry Barkworth Shrewsbury

The symptoms that you describe sound like a classic memory problem to me. I would suspect a problem with your 4Mb upgrade, although the fault may not lie with the upgrade itself. Depending upon the design of the upgrade, the connector running from the memory to the memory controller may run close to - for instance the cable for the floppy drive. Have you recently altered the position of any hardware inside your machine, for instance the high-density drive?

Assuming that it is the memory board, then your approach depends upon who supplied the board. If the extra memory was bought recently, then your supplier may be able to fix the fault cheaply and easily. If it was bought a number of years ago the solution may be more expensive, as the upgrade design is probably obsolete.

In any case, a good first step is to press gently but firmly on all the connections on the upgrade, including the ribbon cable connecting the memory to the memory controller. Sometimes problems are caused by nothing more than a dodgy connection.

If this doesn't cure it, then talking to your local dealer is probably the best option, who will be able to advise you on how to get the machine repaired.

Help wanted

Ben Mearns of Perth, Western Australia writes:

'I would like to know any information about good PD games and how to get them (I do not have Internet access). Is it possible to get PD games in Australia, and if so, how much do they cost?'

Acorn User (and Ben) would be grateful for any information that our Australian readers can AU provide on this point.

SCSI, IDE and other CD-ROM connections

Acorn User's recent CD-ROM drive offer threw up a number of gueries about the different ways in which a CD-ROM drive can be attached to an Acorn computer, so here are some answers.

Dedicated interfaces

Probably the simplest way to connect a CD-ROM drive is to buy one with a dedicated expansion card. This plugs into one of the podule expansion slots in the computer and provides an interface to the CD-ROM. These cards are CD-ROM-only; they cannot be expanded with further peripherals. They are often cheaper than other solutions.

A similar idea is employed by the parallel port CD-ROM drives. These have an interface which plugs into the printer port on the computer. Since double-speed CD-ROM drives only have a relatively slow data transfer rate anyway, the slowness of the parallel port is not really a problem with these drives. Printers and dongles can be daisy-chained off the end with no problems, although other parallel-port devices may interfere with the operation of the drive.

Unfortunately, this solution is only available to those with bidirectional printer ports: A5000, A4, A3010, A3020, A4000 and Risc PC. In fact, this is pretty well the only way to connect a CD-ROM drive to an A4. These drives are easily portable between machines, including (with suitable driver software) to IBM-compatibles.

SCSI interfaces

SCSI CD-ROMs are increasingly becoming available. These connect into a SCSI chain, which may have up to seven other devices attached: hard drives, scanners and so on. One of the advantages of this is that all the devices can be run off one single expansion card; another is speed, although this is perhaps less important with CD-ROM drives than with, say, a hard drive. The new SCSI II cards are in principle faster than original SCSI I cards, although there are other considerations. Morley's cached SCSI I card tends to out-perform either of the SCSI II cards available at the moment in practice.

What you buy when you go for the SCSI solution is one SCSI card, which you then connect your SCSI devices to. You do not need to buy a further SCSI card each time you buy another SCSI device - up to the maximum of seven devices, of course. You only need to buy the card when you buy the first SCSI device. Only the A540 came with SCSI as standard, it is extra on all other machines. In principle, any SCSI device should be compatible with any card. Things aren't actually that simple in practice, and it is wise to check if a particular device does actually work with the card you have in your machine before buying it.

Connecting a CD-ROM drive to a SCSI card is a little bit more complicated than just plugging it in - you also need a driver (a small software module) for it. If it has been bought from an Acorn dealer, the driver will usually have been provided. However, if it has been bought from somewhere else - perhaps for use with a Mac as well - then you will need a separate driver. Eesox (tel: (01223) 264242) and Morley (tel: 0191-257 6355) both do a range of such drivers, and it is worth asking other manufacturers.

IDE interfaces

The Risc PC comes with an IDE internal hard disc. The IDE interface is similar to the SCSI interface, but is a poorer relation as it is usually slower and can only take a maximum of two devices. Nonetheless, this is enough to allow you to connect an internal IDE CD-ROM into the 5.25in bay of your Risc PC - a good solution if you have such a machine. You can't then connect a second hard drive, though. Unfortunately, the IDE standard doesn't allow for long connecting cables, so IDE CD-ROM drives cannot easily be used in pre-Risc PC machines.

Programming

p till now, if we've wanted to store a set of related data items such as names or telephone numbers, we've used arrays - David described how to set them up back in the December 1994 issue. As a brief reminder, here's a few examples of array declarations:

```
float numbers[10];
int grid[5][10];
char names[10][25];
char *places[20];
```

It's important to remember that when you declare your arrays, you're specifying the maximum number of elements you'll be using - in the first example, you've defined ten 'cells' starting at numbers[0] and going to numbers[9].

Arrays are quite versatile, but they do have their limitations. If you're writing a simple database to store the contents of your address book, you'd need several arrays to hold the different types of information - one for the names. another for the telephone numbers, and so on. In order to perform an operation on an individual record, you have to examine each array in turn and manually reconstitute the information. It's simple enough to do, but when each record contains a lot of data fields, it quickly becomes tiresome, especially for routine operations like copying one record into another.

Another consequence of arranging the data in separate arrays according to its type is that the natural structure of information is lost - in an address book, all the information for one address is stored in one space; you'd never dream of storing all the phone numbers in a separate chapter and cross-referencing them to the names whenever you wanted to call someone. It's this philosophy that brought about a major addition to the language of C, and it's this addition that I'll be looking at next.

Structures

A structure can be thought of as a group of variables, similar to an entry in an address book. Once you've defined the contents of a structure, you can declare a structure of that type with a single command. Here's how you define a structure:

```
struct mode {
char name[15];
int xres:
int yres;
int colours:
```

Essentially, you put together a list of the items you want the structure to hold, and initialise them as if they were separate variables - the only difference is that you surround the whole lot in braces at the end of a struct command and since it's a command we're dealing with we need to include the semicolon after the closing brace. The example above assigns the name mode as a new variable type. No structures have been created in memory yet; we've just told the compiler how to make one when it needs to. The structure mode contains four elements - a block of 15 bytes in which a name can be stored, the x and y resolutions of the mode, and finally the number of colours. In order to declare a struc-

ture of this type that we can use, we need to do the following:

```
struct mode games;
```

struct mode hires;

It's similar to declaring a variable of any other type, but because mode is a type we've just created - a pseudotype, if you like - we need to remind the compiler of that fact by prefixing it with the struct keyword.

If you're going to be declaring several structures with the same definition, it's common practice to use the typedef command to cut down on the typing. The following example instructs the compiler to treat any MODE instruction it finds as if it were struct mode.

```
typedef struct mode MODE;
MODE games;
```

You can even use the typedef command at the same time as the definition of the structure, which accounts for why you'll see some pretty big differences between structure definitions.

```
typedef struct {
int numerator;
int denominator;
} FRACTION;
FRACTION frac1;
```

So, you've defined and declared your structure, so how do you use it? In the same way that you use an index to look at different elements in an array, you use the names of the members of the structure to access them, by using the dot operator.

```
gets(games.name);
games.xres = 640;
games.yres = 256;
games.colours = 256;
```

In the example above, I'm storing information in the structure named games by adding the appropriate element onto the end of the structure name.

Arrays of structures

It's all very well being able to create a compound variable that can take a whole chunk of related data in one go, but it's not much use

Vour

This month Steve Mumford investigates some alternative methods of data storage.

unless you can create whole stacks of them in one go. However, since we can do almost anything with a structure that we could do with a variable, there's no problem – we just create an array of structures. MODE modes[10];

The above statement declares an array of ten mode structures, and each can contain a name, the x and y resolutions, and the number of colours as before.

A structure in an array is accessed in almost the same way as before, using the dot operator. The following example steps through the array of structures and reads in a name for each of them.

```
for (x = 0; x < 10; x++0) {
printf("Please enter the name for mode
%d:\n", x);
gets(modes[x].name);
}</pre>
```

This allows us to store our list of names and addresses in one large array, and operations such as copying, sorting or deleting records are made much easier by the fact that we can access a whole chunk of data in one go. The code fragment below creates a new structure named chosen and copies the fourth structure from the modes array into it.

```
MODE chosen;
chosen = modes[3];
```

Note that this copies the array of characters in modes[3].name, which would have needed the strepy() function outside a structure.

Advanced structures

So far, we've created individual structures, made arrays of them, and learned how to access the separate elements within them. However, that's only the tip of the proverbial iceberg – since you can do almost anything to a structure that you can with a variable, you can manufacture some pretty interesting data maps.

Firstly, you're not limited to including single variables in structures; you can put arrays within them too. If you want to progress further, you can also include other structures, arrays of structures – the list goes on. There are limitations; if you're defining a structure named address, you're not allowed to refer to structures of that type within its own definition. It's mostly because you fall into a recursion trap – the compiler would try to put the address structure inside itself, and get confused. However, as with most limitations, there's a way round it, and this leads on to such marvels as linked lists and binary trees – more on which next month.

```
struct example {
int array[10][20];
MODE games;
MODE strucarray[5];
};
struct example ex1;
```

Once the rather complex structure shown above has been set up, you can access all the elements within it following the rules laid out earlier. All the following assignments are possible.

```
ex1.array[5][5] = 10;
ex1.games.xres = 640;
ex1.strucarray[3].colours = 16;
```

Pointers to structures

Another important similarity between structures and other variables is the ability to refer to them by their location in memory - by a pointer. This allows structures to be allocated memory dynamically, which is a neater, although more complicated, arrangement than declaring a huge array of them at the start of the program. Taking the example of the address book database, we could either guess at the maximum number of records the user would ever create and set aside enough memory before the program ran, or using pointers, we could wait until the user needed another empty record before allocating the memory. The only snag is that we have to use malloc(), so if you need to brush up on the function, I suggest you browse over David's article in the Christmas 1994 issue of Acorn

```
typedef struct {
int x;
float y;
} SIMPLE;
SIMPLE *var1;
```

The above fragment defines a structure and creates the variable type SIMPLE for it. The last line declares a pointer to a structure of type SIMPLE, but doesn't allocate any memory yet. That's done by using the malloc() function, and the sizeof() function calculates the amount of memory the structure takes up. If it's a more complicated structure, you might have to determine its size for yourself.

```
var1 = malloc(sizeof(SIMPLE));
```

You can't access these structures in quite the same way as the ones mentioned earlier in the column, but a special operator is provided to avoid all those stars and ampersands that are normally associated with pointers. I'll cover that next month, so I'll see you then.

for self

Erratum

Gareth Boden's e-mail address last month was printed incorrectly. For information on CHelp, contact gdb20@cam.ac.uk enus are an important part of using the Archimedes. They are one of the ways of giving instructions to programs. If you want an application to save a file, you will usually be able to do it by choosing the 'Save' option from a menu, even if there are other ways such as combination of key presses. In fact, the key presses to achieve the same action are often shown on the menu, alongside the action.

Navigating the menu structure

Menus are opened in the same way in all applications – by clicking with the middle 'Menu' mouse button. The button is clicked once to display the menu, and the menu displayed is appropriate to whatever was underneath the pointer at the time. Usually, this will be a window belonging to an application, and the menu will be created by the application. There are some areas of the Desktop that do not generate menus, of course, such as an empty area of the icon bar and the borders of windows.

In its simplest form, a menu is a list of actions which the program can perform. For instance, clicking with Menu over the floppy disc icon on the icon bar opens a menu with a list of actions which may be performed on the disc. Some of these verifying the disc, finding out how much free space is on it, and so on - are a single action and require no further input from the user. As the pointer is moved up and down the menu, the action to be performed is highlighted. Clicking with any of the mouse buttons performs the action, though Adjust has the added property that the menu remains on screen - otherwise (with Menu and Select) it is removed.

Formatting the disc does require some further input from the user as the Filer

Absolute beginners

needs to be told what format the disc should be made. The arrow to the right of the word 'Format' indicates that this menu contains a *submenu* which will be opened when the pointer is moved over the arrow. In RISC OS 3 you can also configure submenus to open automatically if the pointer is left over an entry containing a submenu for a short period of time. The menu structure including its submenus is often called a *menu tree*, as it contains ever more submenus branching off the original 'root' menu. In practice, few menu structures go more than three layers deep.

Submenus do not actually need to be menus; they can also be windows. Usually (though this can change) the window is a dialogue box – a simple window allowing you to set several options at once in a more convenient manner to continually going through a menu structure.

Menus are not as permanent as windows; a menu will disappear if the mouse is clicked with the pointer outside the menu structure, it will usually be removed when a choice has been made, and only one menu structure (menus and submenus) may be on screen at once. A submenu will also be removed if the pointer is moved back up the menu tree to an earlier menu.

Like windows, menus can be dragged around the screen by using their title bars, though if you accidentally click just away from the title bar, you will lose the menu. There is no need when moving a menu to keep it over the original window it was opened on; in fact, with large menu structures it can be helpful to move the root menu up to the top left of the screen to have room to open all the submenus.

Flags for menu entries

Apart from actions, menu entries may contain settings. For instance, a font menu will not only let you pick the font in which to display your text, but will show the current setting. It does this by adding a tick symbol to the left of the menu entry if the option is currently selected. Clicking on the menu entry toggles the state of the entry between ticked and unticked – if you use Adjust and so keep the menu on screen, you can see this happening.

A menu entry with an ellipsis (...) following it will, if clicked upon, open a more permanent dialogue box, closing the menu in the process. This dialogue box is a separate window, not part of the menu structure, and will usually remain until the user explicitly removes it.

Some actions which you can perform using a menu may depend upon the status of other settings within a program. For instance, you can only undo an action if you have first done something to undo. If these options were only to appear on menus when they were needed, it could be confusing, with menus constantly changing their layout and contents. Instead, these items are often present but are greyed out and unselectable. Buttons in dialogue boxes can be greyed out in a similar way.

Many menus have dashed dividing lines separating groups of items; this is purely cosmetic and has no deeper significance.

A standard dialogue box, with option icons and two icons where text may be entered. No changes will actually be made until the 'Start' button is clicked upon. Clicking on the Close icon for the window will close the dialogue box without making any changes – there may also be a 'Cancel' button to do this.

Learn to make choices with the menu part of the WIMP and with appropriate key presses in our ongoing series for beginners by David Matthewman.

Key short-cuts

Menu entries are often followed by a keyboard short-cut – a combination of keys which will make the program perform the same action that would be done by clicking on the menu entry. Once these are learned, they offer a quick and easy way to do common and simple actions without having to move your hands from the keyboard.

Such-short cuts often involve the Ctrl key, sometimes in combination with Shift. The function keys along the top of the keyboard (labelled F1 to F12) are also used extensively. For instance, Ctrl-Shift-I (Hold down both the Ctrl and Shift keys

A small menu tree, generated from the floppy disc icon on the icon bar, and showing one submenu.

and type I) is used to insert a frame in *Impression*, while Ctrl-S snaps an object to the grid in *Draw*. The function keys are often used without Shift and Ctrl, and many have standardised uses across many applications. F3 is used to save a file in 99 out of 100 editors, and F1 often starts interactive help.

If recognised, the key short-cut will be processed by the window with the caret (identified because the title bar will be pale brown rather than grey), but if this does not recognise the short-cut it will pass it on. This can occasionally have unexpected effects, but normally works well. For instance F12, Shift-F12, Ctrl-F12 and Shift-Ctrl-F12 are used by the Desktop, so well-behaved applications do not respond to these key-presses but pass them on instead.

Key short cuts are represented on menus using the ^ (Ctrl) and ↑ (Shift) symbols. Note that on Risc PC keyboards, some of the keys are labelled differently from on older machines; most glaringly, 'Copy' is now 'End.' Not all short cuts available need be listed on the menu, though there is usually a full list in the manual for the program. On the other hand, not every menu entry has a keyboard short cut − Filer menus for instance have none − it all depends on the programmer.

As an aside, mouse clicks can also be modified with Shift, Ctrl and Alt keys,

though this feature is much less used on the Archimedes than it is on one-buttonmouse systems like the Mac.

Pop-up menus

There is a certain class of menu which is a little bit different, in that these menus – called *pop-up menus* – can be opened by clicking on a particular icon with any of the three mouse buttons. They tend to be a simple list of alternatives, one of which will be chosen – a particular font, colour, resolution and so on. In all other respects, they behave exactly as menus do.

In order to warn you that a pop up menu is available, the pointer helpfully changes shape into a tiny pop-up menu symbol. There is a 'standard' pop-up menu icon, but such menus may legitimately be produced from other icons which often give a clearer idea of the menu's function. There are several such menus on *Impression's* button bar, for example.

A pop-up menu, showing the standard pop-up menu icon, the changed pointer and the menu itself.

Jargon

Dialogue box: a particular style of window usually containing a number of choices, plus icons to either make the changes or close the box without changing anything. Using Adjust will leave the box on screen, as with menus.

Keyboard short cuts: a combination of key presses which will perform some action, usually one which would otherwise need you to remove your hands from the keyboard and use the mouse.

Menu Tree: also known as the menu structure – a menu and all its submenus and dialogue boxes. Pop-up menus: menus – usually containing a simple list of choices – which are opened by clicking on a particular icon, rather than by clicking specifically with the Menu button.

Submenu: a menu which is obtained by moving the pointer over an arrow in another 'parent' menu rather than by clicking with Menu. The title of the submenu is usually the option in the parent menu which generated the submenu.

All details correct at time of going to press E&OE

Mike Cook continues his hardware series by wiring up his old racing car set to his Acorn. RISC

ow, how many of you have a slot-car racing set that is gathering dust under the bed in a large box? Well, I thought this month I would revive my son Graham's racing car set by attaching it to the computer.

There are many things we can do with a computer and a slot racing set, so many in fact that some of them will have to wait for another time. What I thought I would tackle now is lap timing, as this seems to offer the maximum increase in play value. Racing against the clock gives added interest, especially when you can't find an opponent. You can have lap records for each track layout and can easily assess the results of fine tuning of the cars.

Starting out

When tackling any project like this, the first thing you have to do is decide on your sensor. What we need is something that will give an electrical signal to the computer when a model car passes it. One initial thought was an infrared beam broken by the car, but this would be tricky to implement. It wouldn't be so bad for an individual car as you could mount the emitter and sensor on either side of the track, but when you have two or more lanes you would need to mount one of them in the middle of the track between two cars. This would involve drilling holes in the track and some precise mechanical construction, as there is not a lot of clearance. One possibility would be to mount a reflective optical switch on top of a gantry the cars travelled under, but it would be difficult to detect anything but white cars.

Now, the race set that Graham has is a 'Tomy' and the cars have magnets built-in to keep them attached to the track. Other makes of car also have magnets in their motors so I thought the detection of the magnetic field from the car would make a good way to sense them. Fortunately, you can get Hall effect switches quite cheaply, so I used them here

The Hall effect is quite an important physical phenomenon. What happens is that you take a block of semiconductor material, such as silicon or germanium, and pass a current along its length. If you place this in a magnetic field you will find a voltage appearing across the sides of the block as shown in Figure 1. For a given material, the direction of this Hall voltage corresponds to the direction of the magnetic field, and the size of the voltage is directly proportional to the size of the magnetic field.

The discovery of this effect was most important in our understanding of electronic materials as it went against the then-established theories of electrical conduction. You see, the current of electricity can be considered to be a flow of electrons, which will be deflected by a magnetic field just like they are in a TV tube. However, in some materials a positive Hall voltage was observed, which meant that in some materials, conduction was performed by the flow of positive charge carriers and not the negatively charged electrons.

In fact, it turns out that in these materials, conduction is by a flow of holes, a hole simply being where an electron isn't. If an electron carries a negative charge then a hole will carry a positive charge. It might seem strange at first to think of the movement of a hole, but consider a

Figure 1: The Hall Effect.

glass of fizzy pop. You think of the bubbles travelling upwards, but what is really happening is that the liquid is flowing round the hole to make it appear in another place; it's just simpler to consider the bubble as an entity and plot its path. In solid state physics holes are like that – it is really the electrons that are moving but it is more convenient to consider the hole. How a hole comes to actually possess mass I will leave to the second year of a Physics degree.

Proximity switches

We can use this effect to make extremely sensitive proximity switches, which means we can detect the presence of a magnet over a much greater range or use very much smaller or weaker magnets. While the actual size of the Hall voltage is very small, it is possible to build devices which include an amplifier and threshold circuit, along with the Hall sensor, to produce a complete switch. These switches are extremely easy to use and can be incorporated in a variety of applications.

The switch I chose for this project is the OHN3040U, which is the most sensitive in the catalogue and can be switched by fields of 150

Figure 2: The underside of the slot racer track.

gauss. Simply by adding a single pull-up resistor to this you can get an output the computer can read. The idea is to mount the switch underneath the track so that it will be triggered by the passing car. With the track I had, there were regular small gaps in the plastic exposing the metal conducting rail - these were just the right size to fit the sensor into, secured by a small dab of hot melt glue: see Figure 2. Before permanently fixing them, make sure they will detect your car; if you have difficulty you might have to move the sensor closer to the magnetic field in your car. This is because the strength of a magnetic field drops off very rapidly with distance; in fact the field is inversely proportional to the cube of the distance. The side of the sensor with the writing on is the most sensitive one, and this might even have to be let into the track so that it is closer to the motor.

Luckily with my set-up I had no such problems and my tests showed I could reliably detect the passage of a car. However, the cars do travel at quite some speed and the amount of time spent under the sensor is quite short. I measured pulses of about 5mS when the cars were going at full speed. This is a problem for the computer as it has to be looking at the sensor at the precise time the car passes by in order to see it.

The solution seemed obvious: feed the pulse into a flip flop and let the computer read the flip flop. In that way the passage of the car would be recorded until the computer got round to reading it. Then you could use an output to reset the flip flop for the next lap. So I built a circuit and it tested out fine. Unfortunately, it was one of those cases where the operation was a success but the patient died.

Yes, the system worked well at detecting and storing short pulses, but when the cars were actually running they created so much interference that the flip flops went haywire. This was despite the fact that there was no direct electrical connection between the car motor supply and my sensors. The problem was one of electromagnetic radiated interference and no matter what I tried I could not shift it. The digital ICs did not have enough noise immunity so therefore I had to try a different tack.

Stretching pulses

If you can't latch the pulses then the next best thing is to stretch the pulses so that they are long enough to guarantee your computer will be able to see them, and this is basically what happens

Figure 3 The sensor circuit: make one for each track.

Figure 4: Starting Lights Wiring

in Figure 3. The output from the sensor is normally high and drops low when it detects a magnetic field. The idea is to use the short time it drops low to rapidly charge a capacitor and when it is high to slowly discharge the capacitor, which then stretches the pulse. A circuit that does this is known as a monostable and, although you can get IC monostables, with my earlier problems with interference I decided to steer clear of them and build ones out of transistors.

If you look at the diagram you will see that as the sensor's output drops low the first transistor is turned on - you can only do this with a PNP transistor, sometimes called an 'upside down' transistor. When this turns on it connects the capacitor C to the positive rail and rapidly charges it up. As the car passes and the sensor's output goes high, the transistor turns off and the capacitor starts to discharge through the 100K collector load. However, there is also another discharge path through a resistor into the base of a second transistor to ensure the transistor is switched on while the capacitor is discharging. We can then feed the output of this transistor into the computer and it will be long enough to detect. The capacitor on its base is there to suppress any interference that is picked up. I used tantalum capacitors in this circuit as they are better at dealing with interference than metal foil capacitors.

You will need one of these circuits for each car you want to detect. You can test it by using the port monitor application and simply placing the cars on the track. To add a bit more interest I decided to use some of the computer's outputs to light some LEDs to act as a starting gate. The electrical arrangement is shown in Figure 4 and has simply the outputs driving the LEDs directly, and as these outputs are meant to drive a printer there is just enough power to do this. I mounted them on a gantry I made from cutting out a small cardboard box and simply placed them over the box. As far as I can gather, in a real race the two red lights go on five seconds before

the race and the race is started by the red lights going off and the two lower green lights going on. However, as these are under software control you can do whatever you like in terms of making them flash.

The software interface

With the hardware in the bag we need to write the software. I have written two examples on this month's disc, one for a solo car and the other for two cars. Both programs are quite similar and are designed so that you can expand and embellish them to suit your own needs.

The solo car program assumes the sensor is connected to bit 7 of the control inputs, which,

you will remember from earlier articles, is an inverting input. The first job the program does is to wait until the car is over the sensor. It then proceeds with a ten second countdown, turning the red lights on at five seconds. It then looks at the sensor again and if the car is not over it the program signals a false start. With the car in place the green lights go on and the computer beeps and then enters a loop to time ten laps. The loop consists of two parts, the first holds until the car has left the sensor and the second holds until the car is over the

With two cars the program is a bit more complicated – here we can't afford to wait in a loop so we need to monitor both cars at the same time. The way I do this is to have a variable for each car, which contains either zero or one depending on the state of the last reading of the sensor. Now, if the current reading is not the same as the last reading and the current reading is zero, then the car has just passed over the sensor, so we can work out the time that car has taken to lap.

At the same time we also increment the lap counter for the car and halt the race when either car has reached its tenth lap. The car with the biggest lap count is the winner. There is a slight complication as the second car is read in on bit 6 of the control bits which is a non-inverting input. So that it is treated the same as the first car it is inverted by using the EOR – that's exclusive OR operation.

If you were to need more than two cars then it would be best to rewrite the program using arrays rather than individual variables for each

As I said at the start, this is only the basics of what you can do with a computer and a car race game. I strongly encourage you to experiment and add to it. For example, you might want to add sound effects or even devise a rally game where you get penalty points both for going too slow and too fast. You could also control an opponent's car using a computer, but you might like me to give you a hand with that one: see you next month.

Multiple Connections to LK14

The Risc PC is fitted with two auxiliary audio connectors; these are LK13 and LK14, located in the rear right-hand quadrant of the motherboard (close to the power supply) when viewing the machine from the front. The purpose of LK14 is to enable sound to be output from a CD-ROM drive with audio mixer board, or the 16-bit sound card, or some other audio device to play its output through the internal speaker.

If you have more than one device which requires access to LK14 (for example, if you have a Risc PC fitted with Cumana CD300iA and Acorn 16-bit sound card), you would in theory have to leave one device disconnected because LK14 can only take one header plug. However, Cumana has now produced a small passive splitter which allows up to four audio devices to be connected to LK14. The splitter comprises a small PCB which sits on top of LK14, and is available from: Cumana Ltd, Pines Trading Estate, Broad Street, Guildford, Surrey GU3 3BH, tel: (01483) 503121.

Some motherboards have LK14 comprising 5 pins, whereas others have 4; the 'extra' pin, which is the rearmost on a 5-pin connector, is another earth connection.

Application notes are available from Acorn's ftp site or via its brand new WWW pages.

DOS resolutions

When running certain DOS applications under the Risc PC 486 card you may find that the card switches, without your intervention, from single to multi-tasking mode; the PC display will switch to a RISC OS window. This happens when the DOS application attempts to select a screen mode which is not defined under RISC OS. To prevent this from happening, you will need to create a RISC OS screen mode with the same X and Y resolution as that which is being selected by the DOS application. The first step in creating a suitable screen mode is to discover the correct resolution needed. This can be done by following the steps below.

- When the PC display switches into a RISC OS window, save the PC screen as a sprite.
- Drag the saved sprite into the *Paint* application. A window will open containing a single sprite, *pc_screen*.
- From the main *Paint* menu, select the option 'Display->Full info'. The display will now show the size of the sprite in the form of 'xxx by yyy'. This is the X and Y resolution for the required PC screen.

Armed with this information, you should now be able to create a suitable RISC OS screen mode using the MakeModes application, which is available through a variety of sources

including Acorn's ftp site, various Acorn-related bulletin boards and of course, Acorn Dealers.

Yet more data on ftp.acorn...

The Acorn ftp site ftp.acorn.co.uk has recently had yet more data uploaded to it. The directory /pub/documents /ARM contains copies of a selection of ARM chipset datasheets by kind permission of ARM Ltd, and /pub/documents/circuits contains a small (soon to expand) collection of digitised circuit diagrams for older Acorn

hardware. The circuit diagrams are currently available as compressed sprite format, and as GIFs; the files are rather large so they can preserve sufficient detail that they may be accurately vectorised using an automatic outliner at some later date. If any intrepid readers with ftp access would like to convert these diagrams into something vector-oriented, contact the maintainer of the circuits area (in /pub/documents /circuits/ReadMe) for details.

In addition, a set of updates to some of the tools which comprise part of the C/C++ package has been released; this upgrade is now available in /pub/riscos/releases/Cupdate1.arc. This update should only be used in conjunction with Acorn C/C++ and is covered by the same licence conditions.

For those who do not have ftp access, a floppy disc will be made available for an administration charge of £5 through Acorn Direct at: Acorn Direct, 13 Denington Road, Wellingborough, Northants NN8 2RL.

Also available via ftp are two application notes (including example code) explaining how to write your own Toolbox Object and Gadget modules. These are Application Notes 280 and 281, and are to be found in /pub/documents/appnotes/276-290/280.ps and ftp.acorn.co.uk:/pub/documents/appnotes/276-290/280.arc (replace 280 with 281 for the other Application Note) where files with a .ps extension are PostScript files and files with a .arc extension are archived plain text files.

A version of SparkPlug is available for dearchiving the .arc files in: /pub/riscos/releases/dearchive.bas.

RiscPC Computer Systems

RiscPC offers all the traditional strengths of RISC processing, and a great deal more. It is the world's most cost-effective 32-bit RISC based computer, producing astounding graphics and crystal clear sound. It's innovative design provides virtually unlimited upgrade capability, expanding as your needs increase. Built around the ARM 610 processor, RiscPC pushes computing to the limits, with it's intuitive operating system, support for up to 256Mb RAM, powerful 32-bit graphics and 16-bit sound system. RiscPC allows the use of foreign operating systems via it's unique second processor slot, thus opening up the world of DOS, Windows and Unix to name but a few. Access to CD-ROM and networking is also provided, making RiscPC an ideal multimedia or network

All RiscPC Systems include:

- ARM610 processor running at 30MHz
- RISC OS 3 v3.5 operating system 3.5" 1.6Mb Floppy Disk Drive
- 2, 4 or 8Mb RAM expandable to 256Mb
- 1Mb or 2Mb Video RAM
- 210Mb or 420Mb IDE hard disk drive 8 channel stereo sound
- full 32-bit graphics capabilities
- 2nd processor slot
- 2 or 4 32-bit expansion bus slots 5.25" drive bay for CD-ROM drive
- 14" EPA 0.28mm SuperVGA Monitor 102-key keyboard u 3 button mouse
- optional CD-ROM drive
- 1-year On-Site Warranty (3-year option)

Software

As one of the largest dealer in Acorn software in the UK, we doubt that you will find any of the titles listed here cheaper alsewhere.

Also if there is something you don't see listed, give us a call and we will attempt to source it for you and give you the best price.

All software requires at least 1Mb RAM and RISC OS operating system.

Special notes † - not suitable for RiscPC †† - requires 2Mb RAM ‡ - hard disk required

The day today

Author: Stuart Allison

A bit of frivolity now from Stuart Allison: 'Some time ago Archimedes World published a program, translated from a PC Shareware source by James Noad,' explains Stuart. 'It displayed data relating to anniversaries and events that occurred on this date in the past. Reminders of things to do etc. may also be shown. I liked the idea but not the non-multitasking version. With the help of Joe Telford's excellent WimpEd this version now operates in the Desktop. Run the program as normal and click on the cake to find out what's so special about today.'

Pressing Menu on the Main Window provides the usual options, plus:

Not Today – leads to a dialogue box allowing the display of data from any date. Data relating to day-of-week is not displayed for obvious reasons.

Edit – If a text processor such as *Edit* has been loaded or seen, the data file '.own' (see below) is sent for modification/ addition.

I find that loading this program from the *!Boot* file is (perhaps) its best use. If anyone can be bothered to update the files (more European, less Californian?), please let us know.

The file structure is as follows:

The directory *TodayData* has one data file for each month of the year. They are named: *TodayData.Jan*, *.Feb*, *.Mar* etc. You can also have a personal file named *Today.own*. This is so all your important dates aren't scattered among 12 files. All files are plain vanilla ASCII in this format:

Column 1: The record type which can be a B for birthdays, S for special dates in history or R for a reminder.

Columns 2–5: Month and day as MMDD with leading zeros. Zeros for either month or day cause *all* months or days to match when being scanned. For example, 0001 would match the first of every month

while 0400 would match every day of April.

Columns 6-9: The full year of the event as four digits. May be left blank, in which case the message will move left.

Column 10: A special processing flag. Values may be: blank for no special processing, 'C' to continue a message from the previous line (note that you *must* repeat the date fields) or 'day-of-week digit' where 1=Sunday ... 7=Saturday. This will cause the message to display only if the date falls on a certain day of the week. Look in the November file for voting day examples.

Columns 11 – 70: The message to display for this date.

This format applies to *TodayData.own* also. You can put in birthdays; try putting in reminders a few days before the date in question to give yourself some warning.

Today is Monday 5th June 1995

Birthdays

1723 Adam Smith, economist
1883 John Maynard Keynes, another economist
1980 Dennis Gabor, inventor of holography (3D laser photography)

Anniversaries

1833 Ada Lovelace (future 1st computer programmer) meets Charles Babbage.
1849 Denmark becomes a constitutional monarchy.
1875 formal opening of the Pacific Stock Exchange.
1928 1st rivet driven on Bank of Italy headquarters at 1 Powell.
1981 TODAY ran for 1st time
Constitution Day, celebrated in Denmark

Top Drawer

Author: Dave Acton

Several readers, including Patrick McFaddy of Newcastle, have asked over the months about rendering Draw files in their own programs. Unless you program in C, in which case libraries to handle Draw files exist, it can be a bit tricky to render such artwork in your own program. There are one or two BASIC libraries that do the job, but these can be a bit slow.

After a bit of tinkering, we came up with a small module called Drender. This should satisfy all your Draw file rendering needs and, being in machine code, will do so at a respectable speed too.

Three calls are provided, one to actually render the image and two others to make loading easier:

SYS "DrenderLoad", "drawfile" TO image

loads a Draw file into memory (actually taken from the RMA) and returns a handle. This is in fact the address of the image.

SYS "Drender Discard", image

will throw away an image that is no longer required and will also free up the memory used. Note that when a *Draw* file is loaded, it is preceded in memory by its length, and the handle returned actually points to this word. If you want to load a Draw file in your own program you must allocate an extra word of memory, put the length in the first word and load the file after it.

SYS "Drender_Render", image, flags, x, y, xsc, ysc

does the rendering. Only bit 0 of the flags word is currently used. If set, R4 and R5 contain the x and y scale factors, shifted up 16-bits, so &10000 means full size. R2 and R3 are simply the OS coordinates of where to plot the image.

As well as the module source, a simple example is included on the disc. This includes all the main possible elements of a Draw file and is rendered at two different scales to show that it is possible.

How it works

The code to render a Draw file is not particularly complicated, just a bit fiddly in places. The Draw file itself has a header as shown in figure 1. The bounding box is in *Draw* units, which are 1/256 OS units. Our module expects all the bounding boxes in the file to be

Con	npati	bil	ity	tab	le

Size	Description	
4	type	

bounding box

valid, which they will be if the file has been produced by Draw itself or another reputable program. You can always load a troublesome file into Draw and save again to rebind it correctly.

After the header come the objects. These have headers as shown in figure 2. Our module begins by reading the current graphics window, and then plods through the Draw file, reading the type of each object and using a table to jump to the appropriate piece of code. If ever the bounding box for an object lies outside the graphics window, it is ignored. The possible object types are as follows:

- 0 font table: Usually the first, this is simply a list of font names with one byte numbers by which the fonts are known in text objects. Our module has a table of 256 words and goes through the font table object (which has no bounding box incidentally), storing the address of each font name at the right place in the table.
- 1 text object: This simple, old-style text object has a header including the font number, size and colours required. The text is a simple null-terminated string. Font_FindFont is called having looked up the name in the font table. If this fails, the system font (see below) is used, otherwise a ColourTrans call sets the font colours and Font_Paint is called to plot the text.

Plotting in the system font is tricky. The text must fill the bounding box given, so first the number of characters in the string is counted. A bit of multiplication and division is required to come up with the correct scaling factors and these are used by OS_SpriteOp,51 which plots a scaled character.

- 2 path object: This is the true *Draw* object. Two calls are used to render paths - Draw_Fill if the fill colour is not 'none', and Draw_Stroke if the line colour is not 'none'. A ColourTrans_SetGCOL call gets the closest colour available and the rest of the code is simply concerned with converting the parameters in the path object header into the register values required for the *Draw* module calls.
- 5 sprite object: The standard OS_SpriteOp,52 call is used to plot sprite objects at the appropriate scale. The biggest problem is working out the scale factors and setting up a suitable colour translation table. The former is done by reading the current x and y eigen factors, as well as those for the mode the sprite was defined in.

The colour table is a trickier affair. The ColourTrans_SelectTable call will set up a suitable translation table in most instances, but it seems to go wrong under certain circumstances. If the sprite has 16 or fewer colours then Wimp_ReadPixTrans is used instead. I have experimented by displaying sprites of all denominations (including 32 thousand and 16 million colour ones) in a variety of modes and between them, these two calls seem to get the colours right under all conditions.

- 6 group object: Simple recursion is used to render groups. The bounding box is checked, as with other objects, and the code will only render a group if wholly or partially visible.
- 9 text area object: These are ignored! The extra code to render such objects would be immense and so, given the very limited use of such objects, it is not included here.
- 12 transformed text object: One of the new objects, this is essentially the same as the old-style text object but the header is preceded by a six-word transformation matrix. The Font_Paint call has been extended to plot outline fonts that have been transformed
- 13 transformed sprite object: The other new object type with a similar matrix at the start of its header. The matrix is passed on to OS_SpriteOp 56 which takes a pointer to such a matrix in R6. Before we do this though, we must multiply the transformation matrix by our own scaling matrix to arrive at the correct compound transformation. One of the problems of doing this sort of operation is that numbers can easily overflow - 32-bits is not a lot when numbers in Draw units are 256 times as big as their OS equivalents. For this reason, a 64-bit multiplication routine is used (which breaks down 32 by 32-bit multiplication into four lots of 16 by 16-bit) and after some shifting right and ORing, an accurate answer can be achieved without too much bother.

Losing your marbles

Author: Alistair Turnbull

This is something we think happened to Alistair Turnbull a long time ago... If you've lost your marbles recently, perhaps it would be best if you didn't try running Alistair's latest prog as you're likely to end up ready for one of those stylish jackets with the buckles up the back.

Marbles starts by drawing a shaded ball at various scales and grabbing them off the screen as sprites. Fifty of these balls are then bounced around inside a cube, with the different sized balls used to represent depth. The program does not use depth sorting to correctly position balls further away behind those nearer, but as everything is moving quite fast you don't really notice this shortcoming. The palette is slowly mutated to add a little colour to the proceedings.

Burn: Cycle

Authors: Jan Vibe and David Brown

Sorry, not a port of the CDi game, but the first of two fiery graphical ditties this month. The first comes from the man himself, Jan Vibe. *Flames* is a classic example of a colour cycling automata-

like prog for which Jan is justly famous. If you're interested we've broken Jan's prog down and a line-by-line description can be found in table 1. This might give you the incentive you need to

start writing your own graphical doodles. Our second flaming demo comes courtesy of David Brown. *Fire* is a machine code program that uses dithering to increase the range of colours avail-

able. It does not palette switch and thus gives a much more fluid and realistic flame effect. David has even achieved a convincing heat haze and smoke effect above the flames — we think you'll be quite impressed.

Table 1 - line by line flames

I			
40 50 60 70	Start a timer used to control the colour cycling Colour number used to cycle colours Select a 16-colour screen mode and switch the cursor off Call the colour cycling procedure once to start with to initialise the palette	160	There is a 20 per cent chance that the colour read will be changed. RND(1) returns a floating point value between 0 and 1. The colour is changed by adding 1 (using modular 15 arithmetic). This ensures that the new colour remains in the range 1-15 and that colour 0 is still not used
80,110	A loop for all the points across the bottom of the screen	170	Selects the colour to use
90	Select a random colour 1 to 15. Colour 0, (normally black,	180	Plot the point

Singing corner

Author: Mr P Adamson

Going back to August 1993, we carried a short program by Robert Adamson to quickly dismount floppies:

'To avoid the desktop getting confused it is recommended you dismount each floppy after use,' Robert said. 'This entails bringing up the disc menu each time and which can be a pain when looking through a whole batch of discs. So, try this utility instead.' Fourteen-year-old Robert provided a short desktop application which sat on the icon bar.

Two years later, here is a machine code version of the same program by Nicholas Marriott. Being a module task it takes up much less memory than the original.

Just click on the dismount icon with Select to dismount the disc in drive 0. Conversely, clicking with Adjust mounts the drive 0 disc. To keep the code even smaller, Nicholas doesn't provide a menu, so to quit the task either RMKill the module or use the task manager window (find the entry for *Dismount*, click with Menu and choose Quit).

Our regular trip to Singing corner continues with a further collection of MIDI files from Mr P Adamson. This month he has provide two sets of tunes, three blues and three 'traditional.' Files should play well through *Perform* or *Rhapsody*, although scores may need editing for correct print out.

Bluebrass was originally written for a mixed ability brass quartet with the lead being harder than the other parts.

Busker Blues was written for a duet of Clarinet and Eb Sax – not transposed as MIDI file.

John Browns Boogie is the traditional tune given Bluesy treatment originally written for recorders.

Hatikvah and Hava Nagila are traditional Jewish tunes while Little Brown Jug is of American origin.

The Israeli tunes are arranged in traditional style whereas the *Little Brown Jug* is semi-swing/Blues. It is quite hard to arrange without thinking of Glenn Miller. The middle section is Little Red Wagon.

Ohm improvement

Author: Paul Marshall

Our regular electronics expert Paul Marshall adds another utility to his suite of circuitry aids. AnyRC will help you get your

Resistance

Best parallel

Best series

) Capacitance

Highest accuracy

Closest values within

Using one value fixed at

43.000

3.000

resistances spot on, as the author explains:

'Only a finite number of different resistor values are manufactured. Low cost ranges in common use have only 12 'preferred' values per decade, thus there is a difference between adjacent values of 20 per cent, although the resistors themselves may have a tolerance of five per cent or even two per cent.

'Virtually any intermediate value can be obtained by using two resistors in series or in parallel. A parallel pair is usually more conve-

nient for a printed circuit board layout, while series is better for high voltage applications. The value of resistors in parallel is given by:

R = 1/(1/r1+1/r2)

and in series simply by:

R = r1 + r2.

'AnyRC calculates the two values required to obtain a given target resistance. It may be desirable to keep the two values as close to each other as possible to aid power sharing or voltage distribution, so the option is provided to achieve this, provided the tolerance of the target value can be relaxed.

'In 'Highest Accuracy' mode the results are only displayed when closer than 20 per cent, but usually the results are surprisingly accurate. Another mode allows one of the values to be chosen by the user. This can be faster if you know near enough what one value will be. The program also tells the user if a single value would be closer than a pair. 'Select the various options, then

enter the target value in the "required" box. Press Return, or click on "Calculate." The displayed results can also be altered to see the result of changing one

Calculate

0.01 % error

0.00 % error

Values per decade

12 @ 24

or both values.

'The algorithm used is rather crude – the program simply tries every combination to see which is best, so is therefore rather slow. No doubt a proper mathematician could come up with something better.

'Capacitors can also be calculated, and 12 or 24 values per decade selected. When entering the value to be calculated the suffix K, M, n or u (for µ) may be used. Ohms or pf are used by default. Notice I

didn't use the omega symbol for ohms because there isn't one – The program redefines system font character 191 to omega'.

(This is normally a Spanish-style upside-down question mark, so if there are any Spanish or Latin American users with questions about ohms, they will need to make their own arrangements).

All manner of submissions are welcome – doodles or applications of a more serious nature alike. Musical offerings like Mr Adamson's MIDI tunes would also be welcome, as would any Risc PC graphical ditties. Send them to:

*INFO, Acorn User, IDG Media, Media House, Adlington Park, Macclesfield SK10 4NP (e-mail starinfo@acornusr.demon.co.uk)

Please put your name, address and program title on every disc and include a text file containing at least your name, address and disc contents. An SAE will ensure your discs are returned and any other instructions, diagrams, saved screens and so on are most welcome.

Blinds is an easy to use, but sophisticated 'Pinboard' type application which will make your life a whole lot more effortlessly when using your computer

- · Have blinds which snap open and close at the click of a mouse, therefore taking up no valuable desktop space.
- · Give your icons long meaningful names at last!
- · Change the icon displayed by choosing from over one thousand sprites we have provided.
- Set windows to open automatically whenever your favourite application is loaded. You'll never have to look for that elusive file again!
- · Make a blind which will attach itself to the side of your application, it will then follow your favourite application's window around the desktop just like it was made for it!

RISC USER review - "it went straight onto my icon bar!"

Blinds costs only £19.95 plus £1.00 Postage, etc. No.V.A.T. Blinds requires RISC OS 3.10 or better.

A demonstration disc is available free of charge on receipt of a A5 size SSAE. You'll find *Blinds* is available from all good Acorn software dealers or direct from:

Quantum Software at 35 Pinewood Park, Livingston.

The Moxon Interview

Andrew Foyle

We can talk to customers as human beings, while we have the technical knowledge to develop material – this skill is increasingly in demand t's uncanny how many times you hear that the key to business success is 'it's who you know'. Looking back on the history of Andrew Foyle, founder and director of VTi and Eclipse, it rings true: he's had more fingers in more pies than Little Jack Horner.

'It all started back in 1989 when myself and Hugo Fiennes set up The Serial Port,' remembers Andrew. 'The product which made us a household name was a parallel port joystick interface, confusingly called The Serial Port Joystick Interface.'

There were other important products, like one of the first SCSI interfaces for the Archimedes, but towards the end of 1991 Andrew's side of the business – the side that developed the products – decided to go solo. So Andrew and his two main aides, Richard Jelbert and Jason Tribbeck, needed a company name, and quickly.

'We had a crisis meeting in a pub,' says Andrew, 'and came up with "Vertical Twist" as a good, techie name for the company. The inspiration for the name came from the Archimedes screw: vertical twist, geddit?'

So Vertical Twist continued to develop products. Turnover grew, and the company set up a number of deals with other suppliers to provide products to be badged under other names. The company soon realised that the games market was an area ripe for milking – at the time the main games companies were 4th Dimension and Krisalis, and there was a growing market for conversions from other platforms.

'It was with game conversions in mind that we secured a number of licences,' says Andrew. 'We got Xenon II from The Bitmap Brothers, James Pond II and Global Effect from Millenium, and Dune II from Virgin, and on this basis our games company, Eclipse, was born.

'We also acquired Software 42, which gave us ArcFS 2 and a number of games – like Fred, Cycloids and Ixion – which gave Eclipse a product range straight away.'

Initially, most of these conversions were marketed in conjunction with Gamesware, but having worked on *Simon the Sorcerer* and *Playdays*, Eclipse went solo and now sells and develops games on its own. It was at this time that the Vertical Twist name, thought too esoteric and technical, was changed to VTi.

So, after a number of years working with other companies and providing products under other labels – Northwest SEMERC's Resound sampler is a re-badged VTi printer port sampler, for example – the development team that brought you some of the best game conversions is doing its own thing.

'Now VTi/Eclipse is regarded as one of the larger Acorn companies,' says Andrew. 'We're certainly one of the largest providers of games, and one of the larger providers of hardware addons. We're overhauling our entire product range so it is more focused and has more mass appeal, but our core activity is to develop new products.

'Some products we'll publish ourselves; some will be published by other companies; and some will be developed under contract. But we'll definitely continue to release new products for the Acorn range.'

And, as befits an innovative company, VTi is looking to the Internet as a potentially huge market for those who join it at the right time.

'We're going to provide a one-stop Internet shop,' says Andrew. 'We'll have everything from WWW space to Internet connections to all-in packages. We won't just sell access links to the Internet, we'll sell complete packages, including modems, cables and so on, that you can simply plug in and use straight away.

'We see major growth for the company in this area. We'll be able to provide on-line upgrades for VTi products and on-line technical support for all our products.'

As far as Acorn users are concerned, then, this is the chance for Acorns to find a real home on the net. The biggest Internet provider at the moment – Demon – has an Acorn support area, but it's horribly over-subscribed, and getting onto the net is far from plug-and-play: it's all Public Domain software and editing strange Autoexec files full of IP addresses and acronyms. VTi intends to simplify the whole thing, while looking at the whole on-line marketplace at the same time.

'Online Media is another interesting area', says Andrew. 'We're doing a version of *Dune II* for the set-top box, and this is potentially just the tip of the iceberg. We have a skill in that we can talk to customers as human beings, while we have the technical knowledge to develop material – this skill is increasingly in demand.'

So we can expect VTi to have more fingers in more pies. But globally, this time.

Mark Moxon AU

REMOVABLE HARDDRIVE SYSTEM

* TOTAL DATA SECURITY

* EASY DATA TRANSFER

BETWEEN COMPUTERS

* IDEAL HARDDISC BACKUP

The removable harddrive system fits into a 5¼" drive slot in the RiscPC and harddrives are available in many sizes which can simply plug in and out of the slot as required. The drive may be locked in place to prevent unauthorized

removal. For total security the drive may be removed and stored in a safe place to prevent unauthorized access to your data. Because the removable drives are available in any size, they are also ideal for use as backups for existing harddrives, and may be easily transported between different computers for rapid transfer of large datafiles. The system is available for use with both IDE and SCSI filing systems.

PAL TV CODERS

There are now two coders in our range which cover all Acorn computer models and allow Computer output in virtually all screen modes to be converted to a PAL TV signal suitable for recording to a video recorder or displaying on any TV with a Video input socket. The PLC/3 is our standard model which works in any of the 'standard TV' modes (eg modes 12 & 15) on all Acorn computer models. (Note that the AKF60 & AKF85 monitors will not work in these modes, although the PLC/3 will still produce a TV output with the RiscPC).

A new addition to the range - the AVK/3 will work with all computer models in all screen modes up to 800 x 600 resolution in 16 million colours. It has a remote control with facilities for zooming, freezing & panning the TV picture. Ideal for lectures and demonstrations etc. Older Acorn Computer models may have 9 pin monitor sockets. 9 to 15pin & 15 to 9 pin converters are available at £4.11 each.

Fast processors
Software executes at real PC
speeds with a choice of powerful 486DX-40 or 486DX2/80

processors blazing through all your tasks.

Windows support

You can use most standard Windows or DOS software on the Risc PC card – at the same time as your existing RISC OS software. You may also wish to connect to existing PC networks.

the cost of buying separate systems: the PC card can use all your Acorn peripherals including hard discs, removable discs and CD-ROMs, Ethernet network cards and printers.

Save money compared with

Connect to PC networks

Use the Risc PC card with optional networking software to bridge between your computer and local area networks. Any PC network server can be used – Novell Netware or Windows.

ARM graphics support

While you're working in Windows, the RiscPC's ARM processor is still busy acting as a graphics accelerator to further boost performance. High-resolution Risc PC video modes are supported, up to 1280x1024 resolution. Subject to suit-

Recommended retail prices

Choose from the 486DX-40, running at 40MHz, for £349, and the 486DX2/80, running at 80MHz, for £399. Cards are available direct from Aleph One.
